## Legal information

### Warning concept

This Manual contains information which you must observe to ensure your own personal safety as well as to avoid material damage. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to equipment damage have no safety alert symbol. Depending on the hazard level, warnings are indicated in a descending order as follows:

 <b>DANGER</b>
indicates that death or serious injury <b>will</b> result if proper precautions are not taken.
 <b>WARNING</b>
indicates that death or serious injury <b>could</b> result if proper precautions are not taken.
 <b>CAUTION</b>
indicates that minor personal injury can result if proper precautions are not taken.
<b>NOTICE</b>
indicates that property damage can result if proper precautions are not taken.

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified personnel

The product/system described in this documentation may only be operated by **personnel qualified** for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

 <b>WARNING</b>
Siemens products are only permitted to be used for the applications envisaged in the catalog and in the associated technical documentation. If third-party products and components are to be used, they must be recommended or approved by Siemens. These products can only function correctly and safely if they are transported, stored, set up, mounted, installed, commissioned, operated and maintained correctly. The permissible ambient conditions must be adhered to. Information in the associated documentation must be observed.

### Trademarks

All names identified with ® are registered trademarks of Siemens AG. Any other names used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of liability

We have verified that the contents of this document correspond to the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. The information given in this document is reviewed at regular intervals and any corrections that might be necessary are made in the subsequent editions.

## 1.1 General safety instructions

### WARNING

#### **Danger to life if the safety instructions and residual risks are not observed**

If the safety instructions and residual risks in the associated hardware documentation are not observed, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

### WARNING

#### **Malfunctions of the machine as a result of incorrect or changed parameter settings**

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

## 1.2 Warranty and liability for application examples

The application examples are not binding and do not claim to be complete regarding configuration, equipment or any eventuality which may arise. The application examples do not represent specific customer solutions, but are only intended to provide support for typical tasks. You are responsible for the proper operation of the described products. These application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

## 1.3 Industrial security

---

### Note

#### Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens products and solutions only represent one component of such a concept.

The customer is responsible for preventing unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit:

Industrial security (<http://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed at:

Industrial security (<http://www.siemens.com/industrialsecurity>).

## 2.1 Overview of parameters

### 2.1.1 Explanation of the parameter list

#### Basic structure of the parameter descriptions

The data in the following example have been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The "List of parameters (Page 25)" has the following structure:

----- **Start of example** -----

<b>pxxxx[0...n]</b>	<b>BICO: Full parameter name / abbreviated name</b>			
<b>CU/PM variants</b>	<b>Access level:</b> 3	<b>Calculated:</b> p0340 = 1	<b>Data type:</b> FloatingPoint32

----- **End of example** -----

The individual pieces of information are described in detail below.

**pxxxx[0...n]      Parameter number**

The parameter number is made up of a "p" or "r", followed by the parameter number and the index or bit field (optional).

Examples of the representation in the parameter list:

- p...                      Adjustable parameters (read and write)
- r...                      Display parameters (read only)
- p0918                    Adjustable parameter 918
- p2051[0...13]        Adjustable parameter 2051, indices 0 to 13
- p1001[0...n]        Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944                    Display parameter 944
- r2129.0...15        Display parameter 2129 with bit field from bit 0 (smallest bit) to bit 15 (largest bit)

Other examples of notation in the documentation:

- p1070[1]              Adjustable parameter 1070, index 1
- p2098[1].3          Adjustable parameter 2098, index 1 bit 3
- p0795.4              Adjustable parameter 795, bit 4

The following applies to adjustable parameters:

The parameter value as delivered is specified under "Factory setting" with the relevant unit in square brackets. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions and parameters:

- Setting the PROFIBUS telegram (BICO interconnection)  
p0922
- Setting component lists  
p0230, p0300, p0301, p0400
- Automatically calculating and pre-assigning  
p0340, p3900
- Restoring the factory settings  
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square parentheses.

**Note**

The parameter list can contain parameters that are not visible in the expert lists of the particular commissioning software (e.g. parameters for trace functions).

**BICO: Full parameter name/Abbreviated name**

The following abbreviations can appear in front of the BICO parameter name:

- **BI:** Binector Input  
This parameter is used for selecting the source of a digital signal.
- **BO:** Binector Output  
This parameter is available as a digital signal for interconnection with other parameters.
- **CI:** Connector Input  
This parameter is used for selecting the source of an "analog" signal.
- **CO:** Connector Output  
This parameter is available as an "analog" signal for interconnection with other parameters.
- **CO/BO:** Connector/Binector Output  
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

**Note**

A BICO input (BI/CI) cannot be interconnected with just any BICO output (BO/CO, signal source).

When interconnecting a BICO input using the commissioning software, only the corresponding possible signal sources are listed.

Function diagrams 1020 ... 1030 explain the symbols for BICO parameters and how to deal with BICO technology.

**G120C variants**

Specifies for which G120C variants (communication) the parameter is valid is. If no G120C variant is listed, then the parameter is valid for all variants.

The following information relating to "G120C variants" can be displayed under the parameter number:

Table 2-1 Information in the "CU/PM variants" field

CU/PM variants	Meaning
	All G120C variants have this parameter.
G120C_CAN	G120C with CAN interface
G120C_DP	G120C with PROFIBUS interface
G120C_PN	G120C with PROFINET interface
G120C_USS	G120C with USS interface

### Access level

Specifies the minimum access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard (not adjustable, included in p0003 = 3)
- 2: Extended (not adjustable, included in p0003 = 3)
- 3: Expert
- 4: Service

Parameters with this access level are password protected.

---

#### Note

Parameter p0003 is CU-specific (belongs to the Control Unit).

A higher access level will also include the functions of the lower levels.

---

### Calculated

Specifies whether the parameter is influenced by automatic calculations.

p0340 determines which calculations are to be performed:

- p0340 = 1 includes the calculations from p0340 = 2, 3, 4, 5.
- p0340 = 2 calculates the motor parameters (p0350 ... p0360, p0625).
- p0340 = 3 includes the calculations from p0340 = 4, 5.
- p0340 = 4 only calculates the controller parameters.
- p0340 = 5 only calculates the controller limits.

---

#### Note

For p3900 > 0, p0340 = 1 is also called automatically.

After p1900 = 1, 2, p0340 = 3 is also called automatically.

---

Parameters with a reference to p0340 after "Calculated" depend on the Power Module being used and the motor. In this case, the values at "Factory setting" do not correspond to the actual values because these values are calculated during the commissioning. This also applies to the motor parameters.

**Data type**

The information on the data type can consist of the following two items (separated by a slash):

- First item  
Data type of the parameter
- Second item (for binector or connector input only)  
Data type of the signal source to be interconnected (binector-/connector output).

Parameters can have the following data types:

- Integer8                I8        8-bit integer number
- Integer16             I16       16-bit integer number
- Integer32             I32       32-bit integer number
- Unsigned8             U8        8 bits without sign
- Unsigned16            U16       16 bits without sign
- Unsigned32            U32       32 bits without sign
- FloatingPoint32      Float     32-bit floating point number

Depending on the data type of the BICO input parameter (signal sink) and BICO-output parameter (signal source), the following combinations are possible when creating BICO-interconnections:

Table 2-2 Possible combinations of BICO interconnections

BICO output parameter	BICO input parameter			
	CI parameter			BI parameter
	Unsigned32 / Integer16	Unsigned32 / Integer32	Unsigned32 / FloatingPoint32	Unsigned32 / Binary
CO: Unsigned8	x	x	–	–
CO: Unsigned16	x	x	–	–
CO: Unsigned32	x	x	–	–
CO: Integer16	x	x	r2050	–
CO: Integer32	x	x	r2060	–
CO: FloatingPoint32	x	x	x	–
BO: Unsigned8	–	–	–	x
BO: Unsigned16	–	–	–	x
BO: Unsigned32	–	–	–	x
BO: Integer16	–	–	–	x
BO: Integer32	–	–	–	x
BO: FloatingPoint32	–	–	–	–
Legend:                    x: x: BICO interconnection permitted –: –: BICO interconnection not permitted rxxxx: BICO interconnection is only permitted for the specified CO parameters				

## Can be changed

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive unit state and that the change will not take effect until the unit switches to another state. One or more states are possible.

The following states are available:

- C(x) Commissioning C: Commissioning  
 Drive commissioning is in progress (p0010 > 0).  
 Pulses cannot be enabled.  
 The parameter can only be changed in the following drive commissioning settings (p0010 > 0):
  - C: Can be changed for all settings p0010 > 0.
  - C(x): Can only be changed for the settings p0010 = x.
 A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.
- U Operation U: Run  
 Pulses are enabled.
- T Ready T: Ready to run  
 The pulses are not enabled and the status "C(x)" is not active.

## Normalization

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100 % (word) or 4000 0000 hex = 100 % (double word)
- p0514: specific normalization

Refer to the description for p0514[0...9] and p0515[0...19] to p0524[0...19]

**Dyn. index (dynamic index)**

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

The following information can be contained in this field:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)
- "MDS, p0130" (Motor Data Set, MDS count)
- "PDS, p0120" (Power unit Data Set, PDS count)

Data sets can only be created and deleted when p0010 = 15.

**Note**

Information on the data sets can be taken from the following references:

Operating Instructions SINAMICS G120 Frequency Converter G120C.

**Unit group and unit selection**

The standard unit of a parameter is specified in square parentheses after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched over, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be switched over.

**Example:**

Unit group: 7\_1, unit selection: p0505

The parameter belongs to unit group 7\_1 and the unit can be switched over using p0505.

All the potential unit groups and possible unit selections are listed below.

Table 2-3 Unit group (p0100)

## Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

#### Parameter values

Min	Minimum value of the parameter [unit]
Max	Maximum value of the parameter [unit]
Factory setting	Value when delivered [unit]  In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0].  A different value may be displayed for certain parameters (e.g. p1800) at the initial commissioning stage or when establishing the factory settings. Reason: The setting of these parameters is determined by the operating environment of the Control Unit (e.g. depending on converter type, power unit).

#### Description

Explanation of the function of a parameter

#### Values

Lists the possible values of a parameter.

#### Recommendation

Information about recommended settings.

#### Index

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) of indexed adjustable parameters:

- Min, Max:  
The adjustment range and unit apply to all indices.
- Factory setting:  
When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.  
When the indices have different factory settings, they are all listed individually with the unit.

## Bit field

For parameters with bit fields, the following information is provided about each bit:

- Bit number and signal name
- Meaning for signal states 0 and 1
- Function diagram (FP) (optional).

The signal is shown on this function diagram.

## Dependency

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

Where necessary, "Refer to:" indicates the following information:

- List of other relevant parameters to be considered.
- List of faults and alarms to be considered.

## Safety guidelines

Important information that must be observed to avoid the risk of physical injury or material damage.

Information that must be observed to avoid any problems.

Information that the user may find useful.

### Danger

## 2.1.2 Number ranges of parameters

### Note

The following number ranges represent an overview for all the parameters available for the SINAMICS drive family.

The parameters for the product described in this List Manual are described in detail in "List of parameters (Page 25)".

Parameters are grouped into the following number ranges:

Table 2-6 Number ranges for SINAMICS

Range		Description
From	To	
0000	0099	Display and operation

**Description:** Operating display for the drive.

**Value:**

- 0: Operation - everything enabled
- 10: Operation - set "enable setpoint" = "1"
- 12: Operation - RFG frozen, set "RFG start" = "1"
- 13: Operation - set "enable RFG" = "1"
- 14: Operation - MotID, excitation running
- 15: Operation - open brake (p1215)
- 16: Operation - withdraw braking with OFF1 using "ON/OFF1" = "1"
- 17: Operation - braking with OFF3 can only be interrupted with OFF2
- 18: Operation - brake on fault, remove fault, acknowledge
- 19: Operation - DC braking active (p1230, p1231)
- 21: Ready for operation - set "Enable operation" = "1" (p0852)
- 22: Ready for operation - de-magnetizing running (p0347)
- 31: Ready for switching on - set "ON/OFF1" = "0/1" (p0840)
- 35: Switching-on inhibited - carry out first commissioning (p0010)
- 41: Switching-on inhibited - set "ON/OFF1" = "0" (p0840)
- 42: Switching-on inhibited - set "OC/OFF2" = "1" (p0844, p0845)
- 43: Switching-on inhibited - set "OC/OFF3" = "1" (p0848, p0849)
- 44: Switching-on inhibited - supply STO terminal w/ 24 V (hardware)
- 45: Switching-on inhibited - rectify fault, acknowledge fault, STO
- 46: Switching-on inhibited - exit commissioning mode (p0010)
- 70: Initialization
- 200: Wait for booting/partial booting

**Dependency:** Refer to: r0046

**Notice:** For several missing enable signals, the corresponding value with the highest number is displayed.

**Note:**

- OC: Operating condition
- RFG: Ramp-function generator
- COMM: Commissioning
- MotID: Motor data identification

**Description:** Sets the access level to read and write parameters.

**Value:**

- 3: Expert
- 4: Service

**Note:** A higher set access level also includes the lower one.

Access level 3 (experts):

Expert know-how is required for these parameters (e.g. BICO parameterization).

Access level 4 (service):

For these parameters, it is necessary that authorized service personnel enter the appropriate password (p3950).

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	95	1
<b>Description:</b>	Sets the parameter filter to commission a drive. Setting this parameter filters out the parameters that can be written into in the various commissioning steps.		
<b>Value:</b>	0: Ready 1: Quick commissioning 2: Power unit commissioning 3: Motor commissioning 5: Technological application/units 15: Data sets 29: Only Siemens internal 30: Parameter reset 39: Only Siemens internal 49: Only Siemens internal 95: Safety Integrated commissioning		
<b>Dependency:</b>	Refer to: r3996		
<b>Notice:</b>	When the parameter is reset to a value of 0, short-term communication interruptions may occur.		
<b>Note:</b>	The drive can only be switched on outside the drive commissioning (inverter enable). To realize this, this parameter must be set to 0.  By setting p3900 to a value other than 0, the quick commissioning is completed, and this parameter is automatically reset to 0.  Procedure for "Reset parameter": Set p0010 to 30 and p0970 to 1.  Once the Control Unit has been booted up for the first time, the motor parameters suitable for the power unit have been defined, and the control parameters have been calculated accordingly, p0010 is automatically reset to 0. p0010 = 3 is used for the subsequent commissioning of additional drive data sets (creating data sets: see p0010 = 15). p0010 = 29, 39, 49: Only for internal Siemens use!

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 6799
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [rpm]	- [rpm]	- [rpm]
<b>Description:</b>	Displays the calculated and smoothed rotor speed. Frequency components from the slip compensation (for induction motors) are not included. r0022 is identical to r0021, however, it always has units of rpm and contrary to r0021 cannot be changed over.		
<b>Dependency:</b>	Refer to: r0021, r0063		
<b>Note:</b>	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The speed actual value is available smoothed (r0021, r0022) and unsmoothed (r0063).		

<b>r0024</b>	<b>Output frequency smoothed / Output frequency</b>

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [Vrms]	- [Vrms]	- [Vrms]
<b>Description:</b>	Displays the smoothed output voltage of the power unit.		
<b>Dependency:</b>	Refer to: r0072		
<b>Note:</b>	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The output voltage is available smoothed (r0025) and unsmoothed (r0072).		
<b>r0026</b>	<b>CO: DC link voltage smoothed / Vdc smooth</b>

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 6799
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [V]	- [V]	- [V]
<b>Description:</b>	Displays the smoothed actual value of the DC link voltage.		
<b>Dependency:</b>	Refer to: r0070		
<b>Notice:</b>	When measuring a DC link voltage < 200 V, for the Power Module a valid measured value is not supplied. In this case, when an external 24 V power supply is connected, a value of approx. 24 V is displayed in the display parameter.		
<b>Note:</b>	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The DC link voltage is available smoothed (r0026) and unsmoothed (r0070). r0026 sets itself to the lower value of the pulsating DC link voltage.		
<b>r0027</b>	<b>CO: Absolute actual current smoothed / Motor current</b>

	- [Arms]	- [Arms]	- [Arms]
<b>Description:</b>	Displays the smoothed absolute actual current value.		
<b>Dependency:</b>	Refer to: r0068		
<b>Notice:</b>	This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used.		

**Note:** Smoothing time constant = 300 ms  
 The signal is not suitable as a process quantity and may only be used as a display quantity.  
 The absolute current actual value is available smoothed (r0027) and unsmoothed (r0068).

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
- [%]	- [%]	- [%]

**Description:** Displays the smoothed actual value of the modulation depth.  
**Dependency:** Refer to: r0074  
**Note:** Smoothing time constant = 100 ms  
 The signal is not suitable as a process quantity and may only be used as a display quantity.  
 The modulation depth is available smoothed (r0028) and unsmoothed (r0074).

<b>Description:</b>	Displays the smoothed torque utilization as a percentage.		
<b>Dependency:</b>	This parameter is only available for vector control. For U/f control r0033 = 0 %.		
<b>Note:</b>	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The torque utilization is available smoothed (r0033) and unsmoothed (r0081). For M_set total (r0079) > 0, the following applies: - Required torque = M_set total - Actual torque limit = M_max upper effective (r1538) For M_set total (r0079) <= 0, the following applies: - Required torque = - M_set total - Actual torque limit = - M_max lower effective (r1539) For the actual torque limit = 0, the following applies: r0033 = 100 % For the actual torque limit < 0, the following applies: r0033 = 0 %		
<b>r0034</b>	<b>CO: Motor utilization thermal / Mot_util therm</b>

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 8017
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [%]	- [%]	- [%]
<b>Description:</b>	Display and connector output for the motor utilization from motor temperature model 1 (I2t). For firmware version < 4.7 SP6 or p0612.12 = 0: - r0034 = (motor model temperature - 40 K) / (p0605 - 40 K) * 100 % From firmware version 4.7 SP6 and p0612.12 = 1: - r0034 = (motor model temperature - p0613) / (p0605 - p0613) * 100 %		
<b>Dependency:</b>	The thermal motor utilization is only determined when the motor temperature model 1 (I2t) is activated. The following conditions are a prerequisite for additional information. - a temperature sensor has not been parameterized (p0600, p0601). - the current corresponds to the stall current (p0318). - speed n > 1 [rpm]. For firmware version < 4.7 SP6 or p0612.12 = 0, the following applies: - the temperature model operates with an ambient temperature of 20 °C.		

A motor utilization of 100% is displayed (r0034 = 100 %) when the following conditions are permanently fulfilled:

- the ambient temperature is 40 °C (model 1: p0625 = 40 °C, model 3: p0613 = 40 °C).

From firmware version 4.7 SP6 and p0612.12 = 1, the following applies:

- the ambient temperature can be adapted to the conditions using p0613.

Refer to: p0605, p0611, p0612, p0613, p0627, r0632

Refer to: F07011, A07012

**Notice:** After the drive is switched on, the system starts to determine the motor temperature with an assumed model value. This means that the value for the motor utilization is only valid after a stabilization time.

**Note:** Smoothing time constant = 100 ms

The signal is not suitable as a process quantity and may only be used as a display quantity.

For r0034 = -200.0 %, the following applies:

The value is invalid (e.g. the motor temperature model is not activated or has been incorrectly parameterized).

**Description:** Displays the power unit overload determined using the I2t calculation.

A current reference value is defined for the I2t monitoring of the power unit. It represents the current that can be conducted by the power unit without any influence of the switching losses (e.g. the continuously permissible current of the capacitors, inductances, busbars, etc.).

If the I2t reference current of the power unit is not exceeded, then an overload (0 %) is not displayed.

In the other case, the degree of thermal overload is calculated, whereby 100% results in a trip.

 r0037[0]: Maximum value of the inverter temperatures (r0037[5...10]).  
 r0037[1]: Maximum value of the depletion layer temperatures (r0037[13...18]).  
 r0037[2]: Maximum value of the rectifier temperatures (r0037[11...12]).  
 The maximum value is the temperature of the hottest inverter, depletion layer, or rectifier.  
 r0037[2, 3, 6, 11, 14...18] is only relevant for chassis power units.  
 In the case of a fault, the particular shutdown threshold depends on the power unit, and cannot be read out.

- Bit 04 = 1 (DC brake active) when:
  - the signal source in p1230 has a 1 signal.
- Bit 08 = 1 (enable signal missing), if:
  - safety functions have been enabled and STO is active.
  - STO is selected via onboard terminals or PROFIsafe.
  - a safety-relevant signal is present with STOP A response.
  - the "STO via terminals at the Power Module" function is selected.

- Bit 10 = 1 (enable signal missing), if:
- the signal source in p1140 is a 0 signal.
- Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:
- the signal source in p1141 is a 0 signal.
  - the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.
- Bit 12 = 1 (enable signal missing), if:
- the signal source in p1142 is a 0 signal.
- Bit 16 = 1 (enable signal missing), if:
- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching-on inhibited" withdrawn with OFF1 = 0.
- Bit 17 = 1 (enable signal missing), if:
- commissioning mode is selected (p0010 > 0).
  - there is an OFF2 fault response.
  - the drive is not operational.
- Bit 18 = 1 (enable signal missing), if:

- Bit 19 = 1 (internal pulse enable missing), if:
- sequence control does not have a finished message.
- Bit 20 = 1 (internal DC brake active), if:
- the drive is not in the state "Operation" or in "OFF1/3".
  - the internal pulse enable is missing (r0046.19 = 0).
- Bit 21 = 1 (enable signal missing), if:
- the power unit does not issue an enable signal (e.g. because DC link voltage is too low).
  - the holding brake opening time (p1216) has still not expired.
  - the hibernation mode is active.
- Bit 26 = 1 (enable signal missing), if:
- the drive is not operational.
- Bit 27 = 1 (enable signal missing), if:
- de-magnetization not completed.
- Bit 28 = 1 (enable signal missing), if:
- the holding brake is closed or has still not been opened.
- Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:
- the pole position identification is active.
  - motor data identification is active (only certain steps).
- Bit 31 = 1 (enable signal missing), if:
- the speed setpoint from jog 1 or 2 is entered.

<b>Description:</b>	Setting the commissioning and control view for various application classes.		
<b>Value:</b>	0: Expert 1: Standard Drive Control (SDC) 2: Dynamic Drive Control (DDC)		
<b>Dependency:</b>	The parameter is preset when commissioning the system for the first time and for the factory setting, depending on the power unit that is connected. Depending on the setting, the ability to see control parameters is restricted depending on the particular application. The following applies for p0096 > 0: The motor data identification routine is preset (p1900 = 12). After the motor data identification, the system immediately goes into operation. The following applies for p0096 = 1: A synchronous motor (p0300 = 2xx) is not possible.		
<b>Note:</b>	When changing p0096 to 1 or 2, when completing commissioning, fast parameterization should be executed (p3900 > 0). Depending on the setting, after quick commissioning and/or automatic parameterization, the procedure for motor data identification as well as the setting of the operating mode and parameterization of the closed-loop control must be appropriately adapted.

Index 1:  
Displays the bootloader version 3 (for CU320-2 and CU310-2)  
Value 0 means that boot loader 3 is not available.

**Dependency:** Refer to: r0018, r0198

**Note:** Example:  
The value 1010100 should be interpreted as V01.01.01.00.

**Description:** Sets the actual code number from r0200 to acknowledge the power unit being used.  
When commissioned for the first time, the code number is automatically transferred from r0200 into p0201.

**Note:** The parameter is used to identify when the drive is being commissioned for the first time.  
The power unit commissioning can only be exited (p0201 = r0200), if the actual and acknowledged code numbers are identical (p0010 = 2).  
When the code number is changed, the connection voltage (p0210) is checked and, if necessary, adjusted.

<b>Description:</b>	The duty cycles can be overloaded provided that the drive converter is operated with its base load current before and after the overload. This is based on a load duty cycle of 300 s.		
<b>Value:</b>	0: Load duty cycle with high overload for vector drives 1: Load duty cycle with low overload for vector drives 6: S1 duty cycle (for internal use) 7: S6 duty cycle (for internal use)		
<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: r3996		
<b>Notice:</b>	The parameter value is not reset when the factory setting is restored (see p0010 = 30, p0970). When the power unit use is changed, short-term communication interruptions may occur.		
<b>Note:</b>	When the parameter is changed, all of the motor parameters (p0305 ... p0311), the technological application (p0500) and the control mode (p1300) are pre-assigned according to the selected application. The parameter has no influence when calculating the thermal overload. p0205 can only be changed to the settings that are saved in the power unit EEPROM.

<b>Description:</b>	Sets the drive unit supply voltage (rms value of the phase-to-phase line supply voltage).		
<b>Dependency:</b>	Set p1254, p1294 (automatic detection of the V <sub>dc</sub> switch-on levels) = 0.		
	The switch-in thresholds of the V <sub>dc</sub> controller (r1242, r1282) are then directly determined using p0210.		
<b>Notice:</b>	If, in the switched-off state (pulse inhibit), the supply voltage is higher than the entered value, the V <sub>dc</sub> controller may be automatically deactivated in some cases to prevent the motor from accelerating the next time the system is switched on. In this case, an appropriate alarm A07401 is output.		
<b>Note:</b>	Setting ranges for p0210 as a function of the rated power unit voltage:

<b>Description:</b>	Sets the braking power of the connected braking resistor.		
<b>Dependency:</b>	Refer to: p1127, p1240, p1280, p1531		

**Note:** When setting a value for the braking power, the following calculations are made:

- p1240, p1280: Vdc\_max control is deactivated.
- p1531 = - p0219: the power limit when generating is set (limited to - p1530).
- the minimum ramp-down time is calculated (p1127) as a function of p0341, p0342 and p1082 (not for vector control with speed encoder).

If the parameter is reset again to zero, then the Vdc\_max controller is reactivated and the power limit as well as the ramp-down time are recalculated.

<b>Description:</b>	Sets the type of the filter at the motor side.		
<b>Value:</b>	0: No filter 1: Motor reactor 2: dv/dt filter 3: Sine-wave filter Siemens 4: Sine-wave filter third-party		
<b>Dependency:</b>	The following parameters are influenced using p0230: p0230 = 1: --> p0233 (power unit, motor reactor) = filter inductance p0230 = 3: --> p0233 (power unit, motor reactor) = filter inductance --> p0234 (power unit sine-wave filter capacitance) = filter capacitance --> p0290 (power unit overload response) = inhibit pulse frequency reduction --> p1082 (maximum speed) = Fmax filter / pole pair number --> p1800 (pulse frequency) >= nominal pulse frequency of the filter --> p1802 (modulator modes) = space vector modulation without overcontrol p0230 = 4: --> p0290 (power unit overload response) = inhibit pulse frequency reduction --> p1802 (modulator modes) = space vector modulation without overcontrol The user must set the following parameters according to the data sheet of the sine-wave filter and also the user must check whether they are permitted. --> p0233 (power unit, motor reactor) = filter inductance --> p0234 (power unit sine-wave filter capacitance) = filter capacitance --> p1082 (maximum speed) = Fmax filter / pole pair number --> p1800 (pulse frequency) >= nominal pulse frequency of the filter Refer to: p0233, p0234, p0290, p1082, p1800, p1802		
<b>Note:</b>	The parameter cannot be changed if the power unit (e.g. PM260) is equipped with an internal sine-wave filter. For sine-wave filters, the test pulse evaluation to detect short-circuits is always deactivated. If a filter type cannot be selected, then this filter type is not permitted for the power unit. p0230 = 1: Power units with output reactor are limited to output frequencies of 150 Hz. p0230 = 3: Power units with sine-wave filter are limited to output frequencies of 200 Hz.

<b>Description:</b>	Enter the inductance of a filter connected at the power unit output.		
<b>Dependency:</b>	This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit. Refer to: p0230		
<b>Note:</b>	When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0) and then the controller calculation (p0340 = 3) is carried out. The parameter cannot be changed if the power unit has an internal sine-wave filter.

<b>Description:</b>	Enters the capacitance of a sine-wave filter connected at the power unit output.		
<b>Dependency:</b>	This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit. Refer to: p0230		
<b>Note:</b>	The parameter value includes the sum of all of the capacitances of a phase connected in series (phase - ground). When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0). The parameter cannot be changed if the power unit has an internal sine-wave filter.

<b>Description:</b>	Sets the number of reactors connected in series at the power unit output.		
<b>Dependency:</b>	Refer to: p0230		
<b>Notice:</b>	The reactor inductances should be the same. If the number of motor reactors connected in series does not correspond to this parameter value, then this can result in an unfavorable control behavior.

<b>Description:</b>	Sets the response to a thermal overload condition of the power unit. The following quantities can result in a response to thermal overload: - heat sink temperature (r0037.0). - chip temperature (r0037.1). - power unit overload I2t (r0036). Possible measures to avoid thermal overload: - reduce the output current limit r0289 and r0067 or the output frequency (for U/f control indirectly via the output current limit and the intervention of the current limiting controller). - reduce the pulse frequency. A reduction, if parameterized, is always realized after an appropriate alarm is output.		
<b>Value:</b>	0: Reduce output current or output frequency 1: No reduction shutdown when overload threshold is reached 2: Reduce I_output or f_output and f_pulse (not using I2t) 3: Reduce the pulse frequency (not using I2t) 12: I_output or f_output and automatic pulse frequency reduction 13: Automatic pulse frequency reduction		
<b>Dependency:</b>	If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only responses can be selected without pulse frequency reduction (p0290 = 0, 1). For a thermal power unit overload, an appropriate alarm or fault is output, and r2135.15 or r2135.13 set. Refer to: r0036, r0037, p0230, r2135 Refer to: A05000, A05001, A07805		
<b>Notice:</b>	If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.		

## 2 Parameters

### 2.2 List of parameters

**Note:** The setting p0290 = 0, 2 is only practical if the load decreases with decreasing speed (e.g. for applications with variable torque such as for pumps and fans).  
Under overload conditions, if the current and torque limits are reduced, and therefore the motor is braked, then forbidden speed ranges (e.g. minimum speed and suppression [skip] speeds) can also be passed through.  
For p0290 = 2, 3, 12, 13, the I2t overload detection of the power unit does not influence the response "Reduce pulse frequency".  
When the motor data identification routine is selected, p0290 cannot be changed.  
For short-circuit/ground fault detection, when the test pulse evaluation is active via p1901 "Test pulse evaluation configuration", the pulse frequency at the instant of switch on is briefly reduced.

<b>Description:</b>	Sets the alarm threshold for power unit overtemperatures. The value is set as a difference to the tripping (shutdown) temperature. Drive: If this threshold is exceeded, an overload alarm is generated and the system responds as parameterized in p0290. Infeed: When the threshold value is exceeded, only an overload alarm is output.

<b>Description:</b>	Sets the fan run-on time after the pulses for the power unit have been canceled.		
<b>Note:</b>	- Under certain circumstances, the fan can continue to run for longer than was set (e.g. as a result of the excessively high heat sink temperature). - For values less than 1 s, a 1 s run on time for the fan is active. - for a PM230 power unit, sizes D - F the parameter is ineffective.

<b>Description:</b>	Selecting the motor type. The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list: 1 = induction motor 2 = synchronous motor xx = motor without code number xxx = motor with code number		

The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/IOP).

The following applies for values < 100:

Motor data must be manually entered.

The following applies for values >= 100:

Motor data are automatically loaded from an internal list.

<b>Value:</b>	0: No motor
	1: Induction motor
	2: Synchronous motor
	10: 1LE1 induction motor (not a code number)
	13: 1LG6 induction motor (not a code number)
	17: 1LA7 induction motor (not a code number)
	19: 1LA9 induction motor (not a code number)
	100: 1LE1 induction motor
	101: 1PC1 induction motor
	105: 1LE5 induction motor
	108: 1PH8 induction motor
	271: 1FG1 synchronous geared motor without encoder
	277: 1FK7 synchronous motor without encoder

**Dependency:** When the motor type is changed, the code number in p0301 may be reset to 0.

When selecting a motor type from the 1LA7 series, parameters of the thermal motor model are pre-assigned as a function of p0307 and p0311.

For p0096 = 1 (Standard Drive Control) synchronous motor types cannot be selected.

**Caution:**

If a motor is selected, which is not contained in the motor lists (p0300 < 100), then the motor code number must be reset (p0301 = 0), if previously a motor was parameterized from the motor list.

**Notice:**

If a catalog motor is selected (p0300 >= 100) and an associated motor code number (p0301), then the parameters that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 1 for p0301 = 1xxxx). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters.

The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assignment (if the particular motor type is listed):

Type/code number ranges

100 / 100xx, 110xx, 120xx, 130xx, 140xx, 150xx

108 / 108xx, 118xx, 128xx, 138xx, 148xx, 158xx

271 / 271xx, 281xx

277 / 277xx, 287xx, 297xx

**Note:**

Once the Control Unit has been switched on for the first time or if the factory settings have been defined accordingly, the motor type is pre-configured to induction motor (p0300 = 1).

If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited.

A motor type with a value above p0300 >= 100 describes motors for which a motor parameter list exists.

**Description:**

The parameter is used to select a motor from a motor parameter list.

When changing the code number (with the exception to the value 0), all of the motor parameters are pre-assigned from the internally available parameter lists.

**Dependency:**

Code numbers can only be selected for motor types that correspond to the motor type selected in p0300.

Refer to: p0300

**Note:**

The motor code number can only be changed if the matching catalog motor was first selected in p0300.

When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected.

If a change is made to a non-catalog motor, then the motor code number should be reset (p0301 = 0).

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	1	50	1
<b>Description:</b>	Sets the number (count) of motors that can be operated in parallel using one motor data set. Depending on the motor number entered, internally an equivalent motor is calculated. The following should be observed in motors connected in parallel: Rating plate data should only be entered for one motor: p0305, p0307 The following parameters are also only valid for one motor: p0320, p0341, p0344, p0350 ... p0361 All other motor parameters take into account the replacement/equivalent motor (e.g. r0331, r0333).		
<b>Recommendation:</b>	For motors connected in parallel, external thermal protection should be provided for each individual motor.		
<b>Dependency:</b>	Refer to: r0331, r0382		
<b>Caution:</b>	The motors to be connected in parallel must be of the same type and size (same order no. (MLFB)). The mounting regulations when connecting motors in parallel must be carefully maintained! The number of motors set must correspond to the number of motors that are actually connected in parallel. After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1, p3900 > 0). For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies: - an individual motor must not be loaded beyond its stall point.		
			
<b>Notice:</b>	If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned.		
<b>Note:</b>	Only operation with U/f characteristic makes sense if more than 10 identical motors are connected in parallel.

	0.000 [Arms]	5000.000 [Arms]	0.000 [Arms]
<b>Description:</b>	Induction motors: Sets the rated motor magnetizing current. For p0320 = 0.000 the magnetizing current is internally calculated and displayed in r0331. Synchronous motors: Sets the rated motor short-circuit current.		
<b>Notice:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The magnetizing current p0320 for induction motors is reset when quick commissioning is exited with p3900 > 0. If, for induction motors, the magnetizing current p0320 is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance p0360 is changed so that the EMF remains constant.

<b>Description:</b>	Sets the maximum permissible motor current (e.g. de-magnetizing current for synchronous motors).		
<b>Notice:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. If p0323 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly.		

**Note:** The parameter has no effect for induction motors.  
The parameter has not effect for synchronous motors if a value of 0.0 is entered. The user-selectable current limit is entered into p0640.

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

The following parameters are influenced using p0340:

p0340 = 1:

--> All of the parameters influenced for p0340 = 2, 3, 4, 5

--> p0341, p0342, p0344, p0640, p1082, p1231, p1232, p1349, p1611, p1726, p1909, p1959, p2000, p2001, p2002, p2003, p3927, p3928

p0340 = 2:

--> p0350, p0354 ... p0360

--> p0625 (matching p0350)

p0340 = 3:

--> All of the parameters influenced for p0340 = 4, 5

--> p0346, p0347, p0622, p1320 ... p1327, p1582, p1755

p0340 = 4:

--> p1290, p1292, p1338, p1340, p1341, p1345, p1346, p1470, p1472, p1764, p1767

p0340 = 5:

--> p1037, p1038, p1520, p1521, p1530, p1531, p1802, p1803, p2390, p2392, p2393

**Note:** p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5.

p0340 = 2 calculates the motor parameters (p0350 ... p0360).

p0340 = 3 contains the calculations of p0340 = 4, 5.

p0340 = 4 only calculates the controller parameters.

p0340 = 5 only calculates the controller limits.

When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.

At the end of the calculations, p0340 is automatically set to 0.

### p0341[0...n]

#### Motor moment of inertia / Mot M\_mom of inert

**Access level:** 3

**Calculated:** p0340 = 1

**Data type:** FloatingPoint32

**Can be changed:** C(3), U, T

**Scaling:** -

**Dyn. index:** MDS

**Unit group:** 25\_1

**Unit selection:** p0100

**Func. diagram:** 6020, 6030, 6031

**Min**

**Max**

**Factory setting**

0.000000 [kgm<sup>2</sup>]

100000.000000 [kgm<sup>2</sup>]

0.000000 [kgm<sup>2</sup>]

**Description:** Sets the motor moment of inertia (without load).

**Dependency:** IEC drives (p0100 = 0): unit kg m<sup>2</sup>  
 NEMA drives (p0100 = 1): unit lb ft<sup>2</sup>

The parameter value is included, together with p0342, in the rated starting time of the motor.

Refer to: p0342, r0345

**Notice:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** The product of p0341 \* p0342 is used when the speed controller (p0340 = 4) is calculated automatically.

<b>Notice:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The parameter influences the thermal 3 mass model of the induction motor. The parameter is not used for synchronous motors (p0300 = 2xx).

	0.000 [s]	20.000 [s]	0.000 [s]
<b>Description:</b>	Sets the excitation build-up time of the motor. This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.		
<b>Caution:</b>	If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note).		
			
<b>Note:</b>	The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384). For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled.

	0.000 [s]	20.000 [s]	0.000 [s]
<b>Description:</b>	Sets the de-magnetizing time (for induction motors) after the inverter pulses have been canceled. The inverter pulses cannot be switched in (enabled) within this delay time.		

**Note:** The parameter is calculated using  $p0340 = 1, 3$ .  
For induction motors, the result depends on the rotor time constant ( $r0384$ ).  
if this time is shortened too much, then this can result in an inadequate de-magnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating).

**Description:** Sets the stator resistance of the motor at ambient temperature  $p0625$  (phase value).  
**Dependency:** Refer to:  $p0625$   
**Notice:** When selecting a catalog motor ( $p0301$ ), this parameter is automatically pre-assigned and is write protected. Information in  $p0300$  should be carefully observed when removing write protection.  
**Note:** The motor identification routine determines the stator resistance from the total stator resistance minus the cable resistance ( $p0352$ ).

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0.00000 [ohm]	120.00000 [ohm]	0.00000 [ohm]	

**Description:** Resistance of the power cable between the power unit and motor.  
**Caution:**  The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which  $p0352$  was changed must be subtracted from the stator resistance  $p0350$  or motor data identification must be repeated.  
**Note:** The parameter influences the temperature adaptation of the stator resistance.  
The motor identification sets the cable resistance to 20% of the measured total resistance if  $p0352$  is zero at the time that the measurement is made. If  $p0352$  is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance  $p0350$ . In this case,  $p0350$  is a minimum of 10% of the measured value.  
The cable resistance is reset when quick commissioning is exited with  $p3900 > 0$ .

<b>Description:</b>	Sets the reference values for the specific scaling of BICO parameters. The specific scaling is active when interconnecting with other BICO parameters, and can be used in the following cases: 1. Parameter with the marking "Scaling: p0514". 2. Changing the standard scaling for parameters with the marking "Scaling: p2000" ... "Scaling: p2007". Relative values refer to the corresponding reference value. The reference value corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). To specifically scale BICO parameters, proceed as follows: - set the reference value (p0514[0...9]). - set the numbers of the parameters, which should be active for the scaling, corresponding to the index of p0514 (p0515[0...19] ... p0524[0...19]). For parameters with the marking "Scaling: p0514", which are not entered in p0515[0...19] to p0524[0...19], the reference value 1.0 (factory setting) applies.

**Description:** Sets the maximum speed of the bearing.

The following applies when calculating the maximum speed (p1082):

- for p0324 = 0 or p0532 = 0, p0322 is used.

- for p0324 > 0 and p0532 > 0, the minimum value from the two parameters is used.

**Dependency:** Refer to: p0301, p0322, p0530, p1082

**Notice:** This parameter is pre-assigned in the case of motors from the motor list (p0301) if a bearing version (p0530) is selected.

When selecting a catalog motor, this parameter cannot be changed (write protection). The information in p0530 should be observed when removing write protection.

If p0532 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3).

If value = 0: An alarm is output and I_max is not reduced. If value = 1: An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired. - for KTY/PT1000, the following applies: I_max. is reduced - for PTC, the following is valid: I_max. is not reduced If value = 2: An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired. If value = 12: Behavior is always the same as for value 2. For motor temperature monitoring without temperature sensor, when switching off, the model temperature is saved in a non-volatile fashion. When switching on, the same value (reduced by p0614) is taken into account in the model calculation. As a consequence, the UL508C specification is fulfilled.

## 2 Parameters

### 2.2 List of parameters

- Dependency:** This parameter is only used for synchronous motors (p0300 = 2xx).  
Refer to: r0034, p0612, p0615  
Refer to: F07011, A07012, A07910
- Notice:** This parameter is automatically pre-set from the motor database for motors from the motor list (p0301).  
When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.  
When exiting commissioning, p0612 is checked, and where relevant, is pre-assigned to a value that matches the motor power, if a temperature sensor was not parameterized (see p0601).
- Note:** When parameter p0611 is reset to 0, then this switches out the thermal I2t motor model (refer to p0612).  
If no temperature sensor is parameterized, then the ambient temperature for the thermal motor model is referred to p0625.

**Notice:** For bit 00:  
This bit is only automatically activated for permanent-magnet 1FT7 synchronous motors. For other permanent-magnet synchronous motors, the user himself must activate motor temperature model 1 (I2t).  
It is only possible to activate this motor temperature model (I2t) for a time constant greater than zero (p0611 > 0).

**Note:** Mot\_temp\_mod: motor temperature model  
For bit 00:  
This bit is used to activate/deactivate the motor temperature model for permanent-magnet synchronous motors.  
For bit 01 (see also bit 9):  
This bit is used to activate/deactivate the motor temperature model for induction motors.  
For bit 02:  
This bit is used to activate/deactivate the motor temperature model for 1FK7 Basic and 1FL5 motors.  
Motor temperature model 3 cannot be simultaneously activated with another motor temperature model.  
For bit 08:  
This bit is used to extend the motor temperature model 1 (I2t).  
The following applies for firmware version < 4.7 SP6 (only bit 0):  
- this bit has no function. Temperature model 1 operates in the standard mode.  
Overtemperature at rated load: p0605 - 40 °C  
Alarm threshold: p0605  
Fault threshold: p0615  
The following applies from firmware version 4.7 SP6 (bits 0 and 8):  
- temperature model 1 operates in the extended mode.  
Overtemperature at rated load: p0627  
Alarm threshold: p5390  
Fault threshold: p5391

For bit 09:

This bit is used to extend the motor temperature model 2.

For firmware version < 4.7 following applies (only bit 1):

- this bit has no function. Temperature model 2 operates in the standard mode.

From firmware version 4.7 the following applies (bits 1 and 9):

- this bit should be set. Temperature model 2 then operates in the extended mode and the result of the model is more precise.

For bit 12 (only effective if a temperature sensor has not been parameterized):

This bit is used to set the ambient temperature for the motor temperature model 1 (I2t).

The following applies for firmware version < 4.7 SP6 (only bit 0):

- this bit has no function. Temperature model 1 operates with an ambient temperature of 20 °C.

The following applies from firmware version 4.7 SP6 (bits 0 and 12):

- the ambient temperature can be adapted to the conditions using p0613.

<b>Description:</b>	Sets the fault threshold for monitoring the motor temperature for motor temperature model 1 (I2t). The following applies for firmware version < 4.7 SP6: - fault F07011 is output after the fault threshold is exceeded. - fault threshold for r0034 = 100 % * (p0615 - 40) / (p0605 - 40).		

## 2 Parameters

### 2.2 List of parameters

The following applies from firmware version 4.7 SP6 and p0612.8 = 1:

- the fault threshold in p0615 is preset when commissioning.
- when a catalog motor with motor temperature model 1 (I2t) is being commissioned for the first time, the threshold value is copied from p0615 to p5391.
- p5391 is of significance for evaluating the fault threshold.

**Dependency:** The parameter is only used for motor temperature model 1 (I2t).

Refer to: r0034, p0611, p0612

Refer to: F07011, A07012

**Notice:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** The hysteresis is 2 K.

**Value:**  
0: No thermal adaptation of stator and rotor resistances  
1: Resistances adapted to the temperatures of the thermal model  
2: Resistances adapted to the measured stator winding temperature

**Note:** For p0620 = 1, the following applies:

The stator resistance is adapted using the temperature in r0035 and the rotor resistance together with the model temperature.

For p0620 = 2, the following applies:

The stator resistance is adapted using the temperature in r0035.

**Description:** Selects the identification of the stator resistance of induction motors after the Control Unit runs-up (only for vector control).

The identification is used to measure the actual stator resistance and from the ratio of the result of motor data identification (p0350) to the matching ambient temperature (p0625) the actual mean temperature of the stator winding is calculated. The result is used to initialize the thermal motor model.

p0621 = 1:

Identification of the stator resistance only when the drive is switched on for the first time (pulse enable) after booting the Control Unit.

p0621 = 2:

Identification of the stator resistance every time the drive is switched on (pulse enable).

p0621 = 3: only for synchronous motors

One-time identification of the cable resistance p0352 without any change in the thermal motor model.

**Value:**  
0: No Rs identification  
1: Rs identification after switching-on again  
2: Rs identification after switching-on each time  
3: Rcable identification once only (only PMSM)

**Dependency:** p0621 = 1, 2: only for induction motors

- perform motor data identification (see p1910) with cold motor.

- enter ambient temperature at time of motor data identification in p0625.

p0621 = 3: only for synchronous motors

- enter the stator resistance in p0350.
- switch-on with the motor cold

Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

Refer to: p0622, r0623

**Notice:**

For p0621 = 1, 2:

The determined stator temperature of the induction motor can only be compared with the measured value of a temperature sensor (KTY/PT1000) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the mean value of the stator winding.

Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.

**Note:**

For p0621 = 1, 2:

The measurement is carried out:

- For induction motors
- When vector control is active (see p1300)
- if a temperature sensor (KTY/PT1000) has not been connected
- When the motor is at a standstill when switched on

When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. This occurs only once, however, when the CU is booted (e.g. after a power failure).

If identification is activated, the magnetizing time is determined via p0622 and not via p0346. The speed is enabled after completion of the measurement.

For p0621 = 3:

The measurement is carried out

- for synchronous motors (permanent magnet)
- When vector control is active (see p1300)
- When the motor is at a standstill when switched on

When identification is activated, the ramp-up time of the current setpoint is defined by p0622 (limited to p0346). The speed is enabled after the measurement has been completed. After the measurement, p0621 is reset and the result is saved in p0352.

<b>Dependency:</b>	Refer to: r0209, p0323		
<b>Note:</b>	The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305. The current limit p0640 is limited to r0209. The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the power unit. The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 > 0 or using the automatic parameterization with p0340 = 3, 5. p0640 is limited to 4.0 x p0305. p0640 is pre-assigned for the automatic self commissioning routine (e.g. to 1.5 x p0305, with p0305 = r0207[1]). p0640 must be entered when commissioning the system. This is the reason that p0640 is not calculated by the automatic parameterization when exiting the quick commissioning (p3900 > 0).

## 2 Parameters

### 2.2 List of parameters

Once the data has been successfully transferred, this parameter is automatically reset to 0. If an error occurs, the parameter is set to a value > 1000. Possible fault causes:

p0804 = 1001:

The parameter backup set in p0802 as the source on the memory card does not exist or there is not sufficient memory space available on the memory card.

p0804 = 1002:

The parameter backup set in p0803 as the source in the device memory does not exist or there is not sufficient memory space available in the device memory.

p0804 = 1003:

No memory card has been inserted.

<b>Description:</b>	Sets the freely assignable motor number for the drive data set changeover. If the same motor is driven by different drive data sets, the same motor number must also be entered in these data sets. If the motor is also switched with the drive data set, different motor numbers must be used. In this case, the data set can only be switched when the pulse inhibit is set.		
<b>Note:</b>	If the motor numbers are identical, the same thermal motor model is used for calculation after data set changeover. If different motor numbers are used, different models are also used for calculating (the inactive motor cools down in each case).

## 2 Parameters

### 2.2 List of parameters

**Note:** This bit is used to initiate a response for the drives when the control fails (F07220). If there is no control available, then binector input p0854 should be set to 1.  
If a control is available, then STW1.10 must be set to 1 (PZD1) so that the received data is updated. This applies regardless of the setting in p0854 and even in the case of free telegram configuration (p0922 = 999).

<b>Description:</b>	Sets the monitoring time for the power unit. The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, fault F07802 is output.		
<b>Dependency:</b>	Refer to: F07802, F30027		
<b>Notice:</b>	The maximum time to precharge the DC link is monitored in the power unit and cannot be changed. The maximum precharging duration depends on the power unit. The monitoring time for the precharging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum precharging duration is exceeded.		
<b>Note:</b>	The factory setting for p0857 depends on the power unit. The monitoring time for the ready signal of the power unit includes the time to precharge the DC link and, if relevant, the de-bounce time of the contactors. If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault.

<b>Description:</b>	Sets the signal source for the command "unconditionally close holding brake".		
<b>Dependency:</b>	Refer to: p0855		
<b>Note:</b>	The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake). For a 1 signal via BI: p0858, the command "unconditionally close the holding brake" is executed and internally a zero setpoint is entered.

<b>Description:</b>	Sets the signal source for the feedback signal from the line contactor.		
<b>Recommendation:</b>	When the monitoring is activated (BI: p0860 not equal to r0863.1), then to control the line contactor, signal BO: r0863.1 of its own drive object should be used.		
<b>Dependency:</b>	Refer to: p0861, r0863		
<b>Notice:</b>	The line contactor monitoring is deactivated if the control signal of the particular drive object is set as the signal source for the feedback signal of the line contactor (BI: p0860 = r0863.1).		
<b>Note:</b>	The state of the line contactor is monitored depending on signal BO: r0863.1. When the monitoring is activated (BI: p0860 not equal to r0863.1), fault F07300 is then also output if the contactor is closed before it is controlled using r0863.1.

**Description:** Displays or sets the PROFIBUS address for PROFIBUS interface on the Control Unit.  
The address can be set as follows:  
1) Using the DIP switch on the Control Unit.  
--> p0918 can then only be read and displays the selected address.  
--> A change only becomes effective after a POWER ON.  
2) Using p0918  
--> Only if all of the DIP switches are set to ON or OFF.  
--> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".  
--> A change only becomes effective after a POWER ON.

**Note:** Permissible PROFIBUS addresses: 1 ... 126  
Address 126 is used for commissioning.  
Every PROFIBUS address change only becomes effective after a POWER ON.

<b>Description:</b>	The parameter is used to initiate the reset of the drive parameters. Parameters p0100, p0205 are not reset. The following motor parameters are defined in accordance with the power unit: p0300 ... p0311.		
<b>Value:</b>	0: Inactive 1: Start a parameter reset 3: Start download of volatile parameters from RAM 5: Starts a safety parameter reset 10: Start loading the parameters saved with p0971=10 11: Start loading the parameters saved with p0971=11 12: Start loading the parameters saved with p0971=12 30: Start loading the delivery state saved with p0971=30 100: Start a BICO interconnection reset 300: Only Siemens internal		
<b>Dependency:</b>	Refer to: F01659		
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0. Peculiarities of communication via PROFIBUS DP: - communication with Class 1 masters (e.g. S7 controllers) is interrupted. - Communication with Class 2 masters (e.g. STARTER) is retained.		
<b>Note:</b>	A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0. Parameter reset is completed with p0970 = 0 and r3996[0] = 0. For p0970 = 1 the following applies: If a Safety Integrated function is parameterized (p9601), then the safety parameters are not reset. In this case, an error message (F01659) is output with fault value 2. The following generally applies: One index of parameters p2100, p2101, p2126, p2127 is not reset, if a parameterized message is precisely active in this index.

<b>Caution:</b>	If a memory card (optional) is inserted – and the USB interface is not used, the following applies: The parameters are also saved on the card and therefore overwrite any existing data!		
			

- Notice:** The Control Unit power supply may only be switched off after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).  
Writing to parameters is inhibited while saving.  
The progress while saving is displayed in r3996.  
For p0971 = 30:  
The original state when delivered is overwritten when executing this memory function.
- Note:** Parameters saved with p0971 = 10, 11, 12 can be loaded again with p0970 = 10, 11 or 12.  
Identification and maintenance data (I&M data, p8806 and following) are only saved for p0971 = 1.

**Description:** Sets the required procedure to execute a hardware reset for the drive unit.

**Value:**

- 0: Inactive
- 1: Hardware-Reset immediate
- 2: Hardware reset preparation
- 3: Hardware reset after cyclic communication has failed

**Danger:** It must be absolutely ensured that the system is in a safe condition.

The memory card/device memory of the Control Unit must not be accessed.

**Note:**

If value = 1:

Reset is immediately executed and communications interrupted.

After communications have been established, check the reset operation (refer below).

If value = 2:

Help to check the reset operation.

Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.

After communications have been established, check the reset operation (refer below).

If value = 3:

The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.

If cyclic communication is not active, then the reset is immediately executed.

After communications have been established, check the reset operation (refer below).

To check the reset operation:

After the drive unit has been restarted and communications have been established, read p0972 and check the following:

p0972 = 0? --> the reset was successfully executed.

p0972 = 0? --> the reset was not executed.

### 2.2 List of parameters

- 62: Fieldbus + analog setpoint
- 63: Fieldbus + fixed speed setpoint
- 66: Fieldbus+fieldbus
- 200: Analog output connection

**Dependency:** When changing this parameter, the following settings are influenced:

Refer to: p1070, p1071, p1075, p1076

**Caution:**

If p1000 is selected as the main setpoint of the fieldbus, the following BICO interconnection is set automatically:  
p2051[1] = r0063

**Notice:**

The parameter is possibly protected as a result of p0922.

For PROFIBUS/PROFINET Control Units, the following applies: The parameter can be freely set by setting p0922 = 999.

When executing a specific macro, the corresponding programmed settings are made and become active.

	02	Initial rounding-off active	Yes	No	-
	03	Save in NVRAM active	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-
<b>Notice:</b>	The following prerequisites must be fulfilled in order to be able to save the setpoint (Bit 03 = 1) in a non-volatile fashion: - Firmware with V2.3 or higher. - Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).				
<b>Note:</b>	For bit 00: 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040. 1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1. For bit 01: 0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0). 1: With ramp-function generator in the automatic mode. For manual operation, the ramp-function generator is always active. For bit 02: 0: Without initial rounding-off 1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows: $r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$ The jerk acts up until the maximum acceleration is reached ( $a_{max} = p1082 [1/s] / p1047 [s]$ ), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time. For bit 03: 0: Non-volatile data save deactivated. 1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1). For bit 04: When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.

	0.00 [ms]	127.00 [ms]	0.00 [ms]
<b>Description:</b>	Sets the time with which new speed setpoints are interpolated. With interpolation, the higher-level control adapts the speed setpoint steps to the time grid of the setpoint channel.		

**Recommendation:** For non-synchronous operation, a setting to the maximum time difference between two setpoints is recommended. For sensorless vector control, interpolation should always be activated if the ramp-up and ramp-down times of the ramp-function generator are very short. The drive must be able to follow the external speed setpoint (the drive does not ramp up at the torque limit).

**Note:** For acceleration precontrol of the speed controller, interpolation prevents torque peaks from occurring if the ramp-up or ramp-down times in the setpoint channel are zero.

When exiting commissioning, the parameter is preset using the automatic calculation if, as setpoint source for the main or supplementary setpoint, a PZD receive word is already set and the ramp-up time is zero.

Interpolation is limited to 127 cycles of the setpoint channel.

p1079 = 0 ms: interpolation is deactivated.

p1079 = 0.01 ms: the interpolation is automatically determined the first time that the speed setpoint is changed. After this, no other changes are made if the send times of the external control increase. Writing to p1079 again initiates the automatic adaptation of the interpolation time.

p1079 > 0.01 ms: interpolation is performed corresponding to the ratio to the computation clock cycle.

**Description:** Sets the lowest possible motor speed.  
This value is not undershot in operation.

**Dependency:** Refer to: p1106

**Notice:** The effective minimum speed is formed from p1080 and p1106.

**Note:** The parameter value applies for both motor directions.

In exceptional cases, the motor can operate below this value (e.g. when reversing).

	0.000 [rpm]	210000.000 [rpm]	1500.000 [rpm]

**Description:** Sets the highest possible speed.

Example:

Induction motor p0310 = 50 / 60 Hz without output filter and Blocksize power unit

p1082 <= 60 x 240 Hz / r0313 (vector control)

p1082 <= 60 x 550 Hz / r0313 (U/f control)

## 2 Parameters

### 2.2 List of parameters

**Dependency:** For vector control, the maximum speed is restricted to  $60.0 / (8.333 \times 500 \mu\text{s} \times r0313)$ . This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over.

If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance.

For reactors and dU/dt filters, it is limited to 120 Hz / r0313.

Refer to: p0230, r0313, p0322

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** The parameter applies for both motor directions.

The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer).

The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0310, p0311 and p0322.

The following limits are always effective for p1082:

$p1082 \leq 60 \times \text{minimum} (15 \times r0310, 550 \text{ Hz}) / \text{pole pair number}$

$p1082 \leq 60 \times \text{maximum power unit pulse frequency} / (k \times \text{pole pair number})$ , with  $k = 12$  (vector control),  $k = 6.5$  (U/f control)

If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). For reactors and dU/dt filters, it is limited to 120 Hz / pole pair number.

During automatic calculation (p0340 = 1, p3900 > 0), the parameter value is assigned the maximum motor speed (p0322). For p0322 = 0 the rated motor speed (p0311) is used as default (pre-assignment) value. For induction motors, the synchronous no-load speed is used as the default value (p0310 x 60 / pole pair number).

For synchronous motors, the following additionally applies:

During automatic calculation (p0340, p3900), p1082 is limited to speeds where the EMF does not exceed the DC link voltage.

p1082 is also available in the quick commissioning (p0010 = 1); this means that when exiting via p3900 > 0, the value is not changed.

For vector control, the maximum speed is restricted to  $60.0 / (8.333 \times 500 \mu\text{s} \times \text{pole pair number})$ . This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over.

When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance.

## 2 Parameters

### 2.2 List of parameters

Example:

p1091 = 600 and p1101 = 20

--> setpoint speeds between 580 and 620 [rpm] are skipped.

For the skip bandwidths, the following hysteresis behavior applies:

For a setpoint speed coming from below, the following applies:

r1170 < 580 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 580 [rpm]

For a setpoint speed coming from above, the following applies:

<b>Description:</b>	The ramp-function generator ramps-up the speed setpoint from standstill (setpoint = 0) up to the maximum speed (p1082) in this time.		
<b>Dependency:</b>	Refer to: p1082, p1123		
<b>Note:</b>	The ramp-up time can be scaled via connector input p1138. The parameter is adapted during the rotating measurement (p1960 > 0). This is the reason that during the rotating measurement, the motor can accelerate faster than was originally parameterized. For U/f control and sensorless vector control (see p1300), a ramp-up time of 0 s does not make sense. The setting should be based on the startup times (r0345) of the motor.

<b>Description:</b>	Sets the ramp-down time for the ramp-function generator. The ramp-function generator ramps-down the speed setpoint from the maximum speed (p1082) down to standstill (setpoint = 0) in this time. Further, the ramp-down time is always effective for OFF1.		
<b>Dependency:</b>	Refer to: p1082, p1123

<b>Dependency:</b>	Refer to: p1082

During the final rounding-off, the output of the ramp-function generator continues to go in the direction of the previous setpoint (overshoot). After the final rounding-off has been completed, the output goes toward the new setpoint. p1134 = 1 (discontinuous smoothing) If the setpoint is reduced while ramping-up, then the output goes immediately in the direction of the new setpoint. <b>Description:</b>	Sets the operating mode for flying restart.				
	The flying restart allows the drive converter to be switched on while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.				

## 2 Parameters

### 2.2 List of parameters

<b>Value:</b>	0: Flying restart inactive 1: Flying restart always active (start in setpoint direction) 4: Flying restart always active (start only in setpoint direction)
<b>Dependency:</b>	For synchronous motors, flying restart cannot be activated. Refer to: p1201 Refer to: F07330, F07331
<b>Notice:</b>	The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent.
<b>Note:</b>	For p1200 = 1, 4, the following applies: Flying restart is active after faults, OFF1, OFF2, OFF3. For p1200 = 1, the following applies: The search is made in both directions. For p1200 = 4, the following applies: The search is only made in the setpoint direction. For U/f control (p1300 < 20), the following applies: The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill. If p1200 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

<b>Description:</b>	Sets the search current for the "flying restart" function. The value is referred to the motor magnetizing current.		
<b>Dependency:</b>	Refer to: r0331		
<b>Caution:</b>	An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.		

<b>Note:</b>	In U/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the actual search current is set as a function of the frequency based on the voltage setpoints. Reducing the search current can also improve flying restart performance (if the system moment of inertia is not very high, for example).

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
10 [%]	4000 [%]	100 [%]	
<b>Description:</b>	Sets the factor for the search speed for flying restart. The value influences the rate at which the output frequency is changed during a flying restart . A higher value results in a longer search time.		
<b>Recommendation:</b>	For sensorless vector control and motor cables longer than 200 m, set the factor p1203 >= 300 %.		
<b>Caution:</b>	An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.		
	For vector control, a value that is too low or too high can cause flying restart to become unstable.		
<b>Note:</b>	The parameter factory setting is selected so that standard induction motors that are rotating can be found and restarted as quickly as possible (fast flying restart). With this pre-setting, if the motor is not found (e.g. for motors that are accelerated as a result of active loads or with U/f control and low speeds), we recommend that the search rate is reduced (by increasing p1203).

0	26	0	
<b>Description:</b>	Sets the automatic restart mode (AR). The parameters must be saved in the non-volatile memory p0971 = 1 in order that the setting becomes effective.		
<b>Value:</b>	0: Inhibit automatic restart 1: Acknowledge all faults without restarting 4: Restart after line supply failure w/o additional start attempts 6: Restart after fault with additional start attempts 14: Restart after line supply failure following man. acknowledgment 16: Restart after fault following manual acknowledgment 26: Acknowledging all faults and reclosing for an ON command		
<b>Recommendation:</b>	For brief line supply failures, the motor shaft may still be rotating when restarting. The "flying restart" function (p1200) might need to be activated to restart while the motor shaft is still rotating.		
<b>Dependency:</b>	The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted. When using an Operator Panel in the LOCAL mode, then there is no automatic start. For p1210 = 14, 16, a manual acknowledgment is required for an automatic restart. Refer to: p0840, p0857 Refer to: F30003		
<b>Danger:</b>	If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is switched on as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is present again. This automatic switching-on operation can only be interrupted by withdrawing the ON command.		
			

**Notice:** A change is only accepted and made in the state "initialization" and "wait for alarm". When faults are present, therefore, the parameter cannot be changed.  
 For p1210 > 1, the motor is automatically started.

**Note:** For p1210 = 1:  
 Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts.  
 For p1210 = 4:  
 An automatic restart is only performed if fault F30003 has occurred on the power unit. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If, for external 24 V power supplies of the Control Unit, additional faults subsequently occur, these are no longer interpreted as line faults and are therefore also not acknowledged.  
 For p1210 = 6:  
 An automatic restart is carried out if any fault has occurred.  
 For p1210 = 14:  
 as for p1210 = 4. However, active faults must be manually acknowledged.  
 For p1210 = 16:  
 as for p1210 = 6. However, active faults must be manually acknowledged.  
 For p1210 = 26:  
 as for p1210 = 6. For this mode, the switch-on command can be entered with a delay. The restart is interrupted with either OFF2 or OFF3. Alarm A07321 is only displayed if the cause of the fault has been removed and the drive is restarted by setting the switch-on command.

<b>Description:</b>	Sets the start attempts of the automatic restart function for p1210 = 4, 6, 14, 16, 26.		
<b>Dependency:</b>	A change is only accepted and made in the state "initialization" and "wait for alarm". Refer to: p1210 Refer to: F07320		
<b>Notice:</b>	After fault F07320 occurs, the switch-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated. After a complete power failure (blackout) the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.		
<b>Note:</b>	A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized (r0056.4 = 1) and an additional delay time of 1 s has expired. As long as a fault is present, an acknowledge command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgment starts again from the beginning. Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available. At least one start attempt is always carried out. After a line supply failure, acknowledgment is immediate and when the line supply returns, the system is switched on. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgment also causes the start counter to be decremented. For p1210 = 26: The start counter is decremented if after a successful fault acknowledgment, the on command is present.

<b>Description:</b>	Sets the delay time up to restart.		
<b>Dependency:</b>	This parameter setting is active for p1210 = 4, 6, 26. For p1210 = 1, the following applies: Faults are only automatically acknowledged in half of the waiting time, no restart. Refer to: p1210		
<b>Notice:</b>	A change is only accepted and made in the state "initialization" and "wait for alarm".		
<b>Note:</b>	The faults are automatically acknowledged after half of the delay time has expired and the full delay time. If the cause of a fault is not removed in the first half of the delay time, then it is no longer possible to acknowledge in the delay time.

<b>Description:</b>	Sets the monitoring time of the automatic restart (AR).		
<b>Index:</b>	[0] = Restart [1] = Reset start counter		
<b>Dependency:</b>	Refer to: p1210		
<b>Notice:</b>	A change is only accepted and made in the state "initialization" and "wait for alarm". After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.		
<b>Note:</b>	For index 0: The monitoring time starts when the faults are detected. If the automatic acknowledgments are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output. The monitoring is deactivated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present). In the case of p1210 = 14, 16, the faults which are present must be acknowledged manually within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time. For index 1: The start counter is only reset to the starting value p1211 if, after successful restart, the time in p1213[1]. The delay time is not effective for fault acknowledgment without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the switch-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed. For p1210 = 26, the fault must have been successfully acknowledged and the switch-on command issued within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time.		

**p1215**      **Motor holding brake configuration / Brake config**

<b>Access level:</b> 2	<b>Calculated:</b> -	<b>Data type:</b> Integer16

0	3	0

**Description:** Sets the holding brake configuration.

**Value:** 0: No motor holding brake available  
3: Motor holding brake like sequence control connection via BICO

**Dependency:** Refer to: p1216, p1217, p1226, p1227, p1228

**Caution:** For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.

**Notice:** If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.

**Note:** If a holding brake integrated in the motor is used, then it is not permissible that p1215 is set to 3.  
if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal.  
The parameter can only be set to zero when the pulses are inhibited.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0 [ms]	10000 [ms]	100 [ms]

**Description:** Sets the time to open the motor holding brake.  
After the holding brake has been controlled (opened), the speed setpoint remains at zero for this time. The speed setpoint is then enabled.

**Recommendation:** This time should be set longer than the actual opening time of the brake. This ensures that the drive cannot accelerate when the brake is applied.

**Dependency:** Refer to: p1215, p1217

**Note:** For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0 [ms]	10000 [ms]	100 [ms]

**Description:** Sets the time to apply the motor holding brake.  
After OFF1 or OFF3 and the controlling (closing) of the holding brake, the drive remains stationary under closed-loop control for this time with a speed setpoint of zero. The pulses are suppressed when the time expires.

**Recommendation:** This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed.

**Dependency:** Refer to: p1215, p1216

**Notice:** If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag.  
If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime.

**Note:** For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

<b>Description:</b>	Sets the speed threshold for the standstill identification. Acts on the actual value and setpoint monitoring. When braking with OFF1 or OFF3, when the threshold is undershot, standstill is identified.		
<b>Dependency:</b>	Refer to: p1227		
<b>Caution:</b>	For closed-loop speed and torque control without encoder, the following applies: If p1226 is set to values under approx. 1 % of the rated motor speed, then the model switchover limits of the vector control must be increased in order to guarantee reliable shutdown (see p1755).		
			
<b>Note:</b>	Standstill is identified in the following cases: - the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired. - the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired. The actual value sensing is subject to measuring noise. For this reason, standstill cannot be detected if the speed threshold is too low.

<b>Description:</b>	Sets the monitoring time for the standstill identification. When braking with OFF1 or OFF3, standstill is identified after this time has expired, after the setpoint speed has fallen below p1226 (also refer to p1145).		
<b>Dependency:</b>	The parameter is pre-assigned depending on the size of the power unit. Refer to: p1226		
<b>Notice:</b>	For p1145 > 0.0 (RFG tracking) the setpoint is not equal to zero dependent on the selected value. This can therefore cause the monitoring time in p1227 to be exceeded. In this case, for a driven motor, the pulses are not suppressed.		
<b>Note:</b>	Standstill is identified in the following cases: - the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired. - the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired. For p1227 = 300.000 s the following applies: Monitoring is deactivated. For p1227 = 0.000 s, the following applies: With OFF1 or OFF3 and a ramp-down time = 0, the pulses are immediately suppressed and the motor "coasts" down. Once the Control Unit has been booted up for the first time or if the factory settings have been defined accordingly, the parameter is defined in accordance with the power unit.

<b>Description:</b>	Setting to activate DC braking.		
<b>Value:</b>	0: No function 4: DC braking 5: DC braking for OFF1/OFF3 14: DC braking below starting speed		
<b>Dependency:</b>	Refer to: p0300, p1232, p1233, p1234, r1239		
<b>Note:</b>	The function can only be used for induction motors (p0300 = 1). For p1231 = 4: The function is activated as soon as the activation criterion is fulfilled. - the function can be superseded by an OFF2 response. Activation criterion (one of the following criteria is fulfilled): - binector input p1230 = 1 signal (DC braking activation, depending on the operating mode). - the drive is not in the state "S4: Operation" or in "S5x". - the internal pulse enable is missing (r0046.19 = 0). DC braking can only be withdrawn (p1231 = 0) if it is not being used as a fault response in p2101. In order that DC braking is active as fault response, the corresponding fault number must be entered in p2100 and fault response p2101 set = 6. For p1231 = 5: DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely (the system waits for demagnetization). Flying restart must be activated if the motor is still rotating. DC braking by means of fault response continues to be possible. For p1231 = 14: In addition to the function for p1231 = 5, binector input p1230 is evaluated. DC braking is only automatically activated when the speed threshold p1234 is fallen below if binector input p1230 = 1 signal. This is also the case, if no OFF command is present. After demagnetization and after the time in p1233 has expired, the drive changes back into normal operation or is switched-off (for OFF1/OFF3). If a 0 signal is applied to binector input p1230, for OFF1 and OFF3 no DC braking is executed. <b>Note:</b> DCBRK: DC Braking

<b>Dependency:</b>	Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)		
<b>Note:</b>	For high input voltages (p0210), the following settings can improve the degree of ruggedness of the Vdc_max controller: - set the input voltage as low as possible, and in so doing, avoid A07401 (p0210). - set the rounding times (p1130, p1136). - increase the ramp-down times (p1121). - reduce the integral time of the controller (p1291), factor 0.5. - reduce the rate time of the controller (p1292, factor 0.5). In this case, we generally recommend to use vector control (p1300 = 20) (Vdc controller, see p1240). If a braking resistor is connected to the DC link (p0219 > 0), then the Vdc_max control is automatically deactivated.

<b>Dependency:</b>	For Standard Drive Control (p0096 = 1), settings p1300 = 0, 2 are possible, for Dynamic Drive Control (p0096 = 2) only p1300 = 20 can be set. Only operation with U/f characteristic is possible if the rated motor speed is not entered (p0311). Refer to: p0300, p0311, p0500			
<b>Notice:</b>	Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%). The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed.			
<b>Note:</b>	For the open-loop control modes p1300 = 5 and 6 (textile sector), slip compensation p1335, resonance damping p1338, and the I <sub>max</sub> frequency controller are switched off internally so that the output frequency can be set precisely. The I <sub>max</sub> voltage controller remains active. During operation (pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.

<b>Notice:</b>	p1302 bit 5 = 1: (only for field orientation p1302 bit 4 = 1) This setting is only selected for very fast acceleration.				
<b>Note:</b>	For bit 03: When the bit is set, when the drive stops, the starting frequency of the motor holding brake is also not fallen below when the actual slip frequency is less than the starting frequency. For bit 04: Field orientation for the closed-loop control of application class Standard Drive Control (p0096 = 1). The field orientation is activated with the automatic calculation if p0096 is set = 1.				

For bit 05 (only effective for p1302.4 = 1):

The starting current when accelerating (p1311) generally results in an increase in the absolute current and flux. With p1302.5 = 1 the current is only increased in the direction of the load. p1302.5 - in conjunction with p1310 and p1311 - are decisive when it comes to defining the quality of the starting response.

For bit 07:

For field orientation (bit04 = 1), an I<sub>q,max</sub> controller supports the current limiting controller (see p1341). Inhibiting the integral component can prevent the drive from stalling under overload conditions.

For bit 08:

Taking into account the saturation characteristic can be activated to improve faster starting operations for high-rating motors.

For bit 09:

For field orientation (bit04 = 1), while the induction motor is being magnetized, the current is automatically increased if the magnetization time p0346 is shortened.

<b>Description:</b>	<p>Defines the voltage boost as a [%] referred to the rated motor current (p0305).            The magnitude of the permanent voltage boost is reduced with increasing frequency so that at the rated motor frequency, the rated motor voltage is present.            The magnitude of the boost in Volt at a frequency of zero is defined as follows:  <math display="block">\text{Voltage boost [V]} = 1.732 \times \text{p0305 (rated motor current [A])} \times \text{r0395 (stator/primary section resistance [ohm])} \times \text{p1310 (permanent voltage boost [\%])} / 100 \%</math>           At low output frequencies, there is only a low output voltage in order to maintain the motor flux. However, the output voltage can be too low in order to achieve the following:</p> <ul style="list-style-type: none"> <li>- magnetize the induction motor.</li> <li>- hold the load.</li> <li>- compensate for losses in the system.</li> </ul> <p>This is the reason that the output voltage can be increased using p1310.            The voltage boost can be used for both linear as well as square-law U/f characteristics.            For field orientation (p1302.4 = 1, default setting for Standard Drive Control p0096 = 1), in the vicinity of low output frequencies, a minimum current is impressed with the magnitude of the rated magnetizing current. In this case, for p1310 = 0%, a current setpoint is calculated that corresponds to the no-load case. For p1610 = 100 %, a current setpoint is calculated that corresponds to the rated motor current.</p>		
<b>Dependency:</b>	<p>The starting current (voltage boost) is limited by the current limit p0640.            Only for p1302.4 = 0 (no field orientation):            The accuracy of the starting current depends on the setting of the stator and feeder cable resistance (p0350, p0352).            For vector control, the starting current is realized using p1610.            Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)            Refer to: p1300, p1311, p1312, r1315</p>		
<b>Notice:</b>	<p>The starting current (voltage boost) increases the motor temperature (particularly at zero speed).</p>		
<b>Note:</b>	<p>The starting current as a result of the voltage boost is only effective for U/f control (p1300).            The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)).            However, these parameters are assigned the following priorities: p1310 &gt; p1311, p1312            For field orientation (p1302 bit 4 = 1, not PM230, PM250, PM260), then p1310 together with p1311 and p1302.5 are mainly responsible for the quality of the drive response.</p>

<b>p1335[0...n]</b>	<b>Slip compensation scaling / Slip comp scal</b>		
<b>Access level:</b> 3	<b>Calculated:</b> p0340 = 1	<b>Data type:</b> FloatingPoint32	
<b>Can be changed:</b> U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> DDS, p0180	
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 6300, 6310	
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0.0 [%]	600.0 [%]	0.0 [%]	

**Description:** Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip).  
p1335 = 0.0 %: Slip compensation deactivated.  
p1335 = 100.0 %: The slip is completely compensated.

**Dependency:** Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360). If the parameters are not precisely known, a precise compensation can be achieved by varying p1335.  
For U/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation.  
For p0096 = 1 (Standard Drive Control), the scaling of the slip compensation is set as default to 100%.  
Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)

**Note:** The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors.  
For synchronous motors, this effect does not occur and the parameter has no effect in this case.  
For the open-loop control modes p1300 = 5 and 6 (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency.  
If p1335 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

<b>Dependency:</b>	Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: p1300, p1349		
<b>Note:</b>	The resonance damping function dampens active current oscillations that frequency occur under no-load conditions. The resonance damping is active in a range from approximately 6 % of the rated motor frequency (p0310). The shutoff frequency is determined by p1349. <b>Description:</b>	Sets the proportional gain of the I_max frequency controller. The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded. In the U/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time).		
<b>Dependency:</b>	In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used. Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)		
<b>Notice:</b>	When deactivating the I_max controller, the following must be carefully observed: When the maximum current (r0067) is exceeded, the output current is no longer reduced. The drive is switched off when the overcurrent limits are exceeded.

<b>Note:</b>	For induction motors only:				
	For bit 01:				
	Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346.				
	The flux differentiation can be switched out if a significant ripple occurs in the field-generating current setpoint (r0075) when entering the field weakening range. However, this is not suitable for fast acceleration operations because then, the flux decays more slowly and the voltage limiting responds.				
	For bit 02:				
	The flux build-up control operates during the magnetizing phase p0346 of the induction motor. If it is switched out, a constant current setpoint is injected and the flux is built up corresponding to the rotor time constant. When quick magnetizing (p1401.6 = 1) is selected and when flux build-up control is de-energized alarm A07416 is displayed.				
	For bit 14:				
	When the function is activated, the following applies:				
	- the optimum flux is calculated and the power loss is entered for optimization purposes				
	- the efficiency optimization (p1580) is not active.				
	It only makes sense to activate this function if the dynamic response requirements of the speed controller are low. In order to avoid oscillations, if required, the speed controller parameters should be adapted (increase Tn, reduce Kp). Further, the smoothing time of the flux setpoint filter (p1582) should be increased.

<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
	Refer to: p0341, p0342		
<b>Warning:</b>	The acceleration precontrol is kept at the old value if the ramp-function generator tracking (r1199.5) is active or the ramp-function generator output is set (r1199.3). This is used to avoid torque peaks. Depending on the application, it may therefore be necessary to disable the ramp-function generator tracking (p1145 = 0) or the acceleration precontrol (p1496 = 0).		
	The acceleration precontrol is set to zero, if the Vdc control is active (r0056.14/15).		
<b>Note:</b>	The parameter is set to 100% by the rotating measurement (refer to p1960).		
	The acceleration precontrol may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled.		
	We also recommend that the precontrol mode is not used if there is gearbox backlash.

<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: r0206, p0500, p1530		

**Note:** The power limit is limited to 300% of the rated motor power.  
 For power units without energy recovery capability, the regenerative power limit is preset to 30 % of the power r0206[0]. For a braking resistor connected to the DC link (p0219 > 0), the power limit when generating is automatically adapted.  
 For power units with energy recovery, the parameter is limited to the negative value of r0206[2].

<b>Description:</b>	Sets the static torque setpoint for sensorless vector control (SLVC). This parameter is entered as a percentage referred to the rated motor torque. For sensorless vector control, when the motor model is shut down, an absolute current is impressed. p1610 represents the maximum load that occurs at a constant setpoint speed.		
<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

**Description:** Sets the configuration for the motor model.  
 Bit 0 = 1: Forces open-loop speed-controlled starting (ASM).  
 Bit 1 = 1: Forces the system to pass through frequency zero, open-loop-controlled (ASM).  
 Bit 2 = 1: Drive remains in full closed-loop control mode, even at zero frequency (ASM).  
 Bit 3 = 1: Motor model evaluates the saturation characteristic (ASM).  
 Bit 6 = 1: If the motor is blocked, sensorless vector control remains speed-controlled (ASM).  
 Bit 7 = 1: Use rugged switchover limits to switchover the model (open-loop/closed-loop controlled) for regenerative operation (ASM).  
 Bit 8 = 1: Open-loop speed controlled operation independent of the speed setpoint (except for OFF3) (ASM).

**Dependency:** Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)  
Refer to: p0500

**Caution:** Do not use bit 6 = 1 if the motor can be slowly reversed by the load at the torque limit. Long delay times due to blocking (p2177 > p1758) can cause the motor to stall. In this case you should deactivate the function or use closed-loop control throughout the speed range (note the information re bit 2 = 1).  

**Note:** Bits 0 ... 2 only have an influence for sensorless vector control, bit 2 is pre-assigned depending on p0500.  
 For bit 2 = 1:  
 The sensorless vector control is effective down to zero frequency. A change is not made into the open-loop speed controlled mode.  
 This operating mode is possible for passive loads. These include applications where the load itself does not generate any active torque and therefore only acts reactively to the drive torque of the induction motor.  
 If bit 2 = 1, then bit 3 is automatically set to 1. Manual de-selection is possible and may be sensible if the saturation characteristic (p1960) was not measured for third-party motors. Generally, for standard SIEMENS motors, the already pre-assigned (default value) saturation characteristic is adequate.  
 When the bit is set, the selection of bits 0 and 1 is ignored.  
 For bit 2 = 0:  
 Bit 3 is also automatically deactivated.  
 For bit 6 = 1:  
 The following applies for sensorless vector control of induction motors:  
 For a blocked motor (see p2175, p2177) the time condition in p1758 is bypassed and a change is not made into open-loop controlled operation.  
 The following applies for sensorless vector control of synchronous motors:  
 For a blocked motor (see p2175, p2177), the speed ramp-function generator is held in open-loop speed controlled operation, and a switchover is not made into closed-loop controlled operation.  
 For bit 7 = 1:  
 The following applies for sensorless vector control of induction motors:  
 If the changeover limits are parameterized too low (p1755, p1756), then they are automatically increased to rugged values by the absolute amount p1749 \* p1755.

The effective time condition for changing over into open-controlled operation is obtained from the minimum value of p1758 and  $0.5 * r0384$ .

Is recommended that bit 7 is activated for applications that demand a high torque at low frequencies, and at the same time require low speed gradients.

Adequate parameterization of the current setpoint must be ensured (p1610, p1611).

For bit 8 = 1: no influence on the functionality of bits 0, 1, 2

The following applies for sensorless vector control of induction motors:

Changeover into open-loop speed controlled operation is no longer dependent on the speed setpoint (except for OFF3), but instead is essentially dependent on time condition p1758. As a consequence, a drive can be started or reversed in closed-loop speed controlled operation with setpoints from an external control system, if these briefly lie in the open-loop speed control range.

**Description:** Sets the configuration for the adaptation circuit of the motor model.

	14	Delay of the precontrol speed to the motor model	Yes	No	-
	15	Reserved	-	-	-

**Dependency:** In U/f characteristic operating mode only bit 7 is relevant.  
 For active motor model feedback (see p1784), the Lh adaptation is internally deactivated automatically.

**Note:** ASM: Induction motor  
 PMSM: permanent-magnet synchronous motor  
 When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is deactivated and is instead taken into account in the motor model.  
 In order that the correction values of the Rs, Lh and kT adaptation (selected using Bit 0 ... Bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor.

For bit 12 (only for synchronous motors and bit 6 = 1):

The pole position identification is only carried out after power on and after the motor has coasted down. The switch-off speed p1226 should be as low as possible. If the power unit is switched off when the motor is stationary, then the next time that the power unit is switched on, the old angle is used as starting value. The precondition applies that while the power unit is switched off the motor does not rotate.

The duration of the pole position identification is shortened using bit 13. As a consequence, the pole wheel angle error can be slightly greater.

<b>Description:</b>	Sets the pulse frequency for the converter. This parameter is pre-set to the rated converter value when the drive is first commissioned.		
<b>Dependency:</b>	Refer to: p0230		
<b>Note:</b>	The maximum and minimum possible pulse frequency is also determined by the power unit being used (minimum pulse frequency: 2 kHz or 4 kHz). When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067). If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter. For operation with output reactors, the pulse frequency is limited to 4 kHz (see p0230). If p1800 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

0		12	0		
<b>Description:</b>	Sets the motor data identification and speed controller optimization.				
	The motor identification should first be performed with the motor stationary (p1900 = 1, 2; also refer to p1910). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating (p1900 = 1, 3; also refer to p1960; not for p1300 < 20).				
	p1900 = 0: Function inhibited.				
	p1900 = 1: Sets p1910 = 1 and p1960 = 0, 1 depending on p1300 When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.				
	With the following switch-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.				
	p1900 = 2: Sets p1910 = 1 and p1960 = 0 When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.				
	p1900 = 3: Sets p1960 = 0, 1 depending on p1300 This setting should only be selected if the motor data identification was already carried out at standstill. When the drive enable signals are present, with the next switch-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.				

p1900 = 11, 12:

The same as p1900 = 1, 2 with the difference, that after the measurement, the system immediately goes into operation. For this purpose, p1909.18 is set = p1959.13 is set = 1 .

**Value:**

- 0: Inhibited
- 1: Identifying motor data and optimizing the speed controller
- 2: Identifying motor data (at standstill)
- 3: Optimizing the speed controller (in rotating operation)
- 11: Motor data ident. and speed controller opt., switch to operation
- 12: Motor data identification (at standstill), switch to operation

**Dependency:** Refer to: p1300, p1910, p1960

Refer to: A07980, A07981, F07983, F07984, F07985, F07986, F07988, F07990, A07991

**Notice:** p1900 = 3:

This setting should only be selected if the motor data identification was already carried out at standstill.

If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).

During the rotating measurement it is not possible to save the parameter (p0971).

**Note:** The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for p1300 < 20 (U/f controls).

An appropriate alarm is output when the parameter is set.

The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

If a reluctance motor has been parameterized, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.

For U/f control (p1300), identification with speed controller optimization does not make sense (e.g. P1900 = 1).

Bit 01: Check for ground fault once/always when the pulses are enabled.

Bit 02: Activation of the tests selected using bit 00 and/or bit 01 each time the pulses are enabled

**Recommendation:** If the ground fault test is incorrectly initiated because the motor is not at a complete standstill, then the pulse cancellation delay time (p1228) should be increased.

**Dependency:** The ground fault test is only possible when the motor is stationary, and is therefore only realized when flying restart is deactivated (p1200 = 0).

Refer to: p0287

**Note:** If a conductor-to-conductor short-circuit is detected during the test, this is displayed in r1902.1.

If a ground fault is detected during the test, this is displayed in r1902.2.

For bit 02 = 0:

If the test was successful once after POWER ON (see r1902.0), then it is not repeated.

For bit 02 = 1:

The test is not only performed after POWER ON, but also each time the pulses are enabled.

 Without de-selection in bit 11, in the closed-loop control mode, the direct inductance LD and the quadrature inductance Lq are measured at a low current.  
 When de-selecting with bit 11 or in the U/f mode, the stator inductance is measured at half the rated motor current. If the stator inductance is not measured but is to be estimated, then bit 0 should be set and bit 11 should be de-selected.  
 Bit 19 = 1:  
 All parameters are automatically saved after a successful motor data identification.  
 If a speed controller optimization run is then selected, the parameters are only saved after this measurement has been completed.

<b>Dependency:</b>	"Quick commissioning" must be carried out (p0010 = 1, p3900 > 0) before executing the motor data identification routine! When selecting the motor data identification routine, the drive data set changeover is suppressed. Refer to: p1900 Refer to: F07990, A07991
<b>Notice:</b>	After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next switch-on command: - current flows through the motor and a voltage is present at the drive converter output terminals. - during the identification routine, the motor shaft can rotate through a maximum of half a revolution. - however, no torque is generated.
<b>Note:</b>	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971). When setting p1910, the following should be observed: 1. "With acceptance" means: The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting. 2. "Without acceptance" means: The identified parameters are only displayed in the range r1912 ... r1926 (service parameters). The controller settings remain unchanged. 3. For settings 27 and 28, the AVC configuration set using p1840 is active. The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it. The duration of the measurements can lie between 0.3 s and several minutes. This time is mainly influenced by the motor size. At the end of the motor data identification, p1910 is automatically set to 0, if only the stationary measurement is selected, then p1900 is also reset to 0, otherwise, the rotating measurement is activated.

## 2 Parameters

### 2.2 List of parameters

**Note:** The following parameters are influenced for the individual optimization steps:  
Bit 01: p0320, p0360, p0362 ... p0369  
Bit 02: p0341, p0342  
Bit 03: p1470, p1472, p1496  
Bit 04: Dependent on p1960  
p1960 = 1, 3: p1400, p1470, p1472, p1496

For bit 12 = 1:  
The selection only has an effect on the measurement p1960 = 1, 2. For the shortened measurement, the magnetizing current and moment of inertia are determined with a somewhat lower accuracy.

For bit 13 = 1:  
After the measurement has been completed, the system immediately goes into closed-loop speed controlled operation.

<b>Description:</b>	Sets the rotating measurement. The rotating measurement is carried out after the next switch-on command. The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300). p1300 < 20 (U/f open-loop control): It is not possible to select rotating measurement or speed controller optimization. p1300 = 20, 22 (encoderless operation): Only rotating measurement or speed controller optimization can be selected in the encoderless mode.		
<b>Value:</b>	0: Inhibited 1: Rotating measurement in encoderless operation 3: Speed controller optimization in encoderless operation		
<b>Dependency:</b>	Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done. When selecting the rotating measurement, the drive data set changeover is suppressed. Refer to: p1300, p1900, p1959, p1967, r1968		
<b>Danger:</b>	For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.		
			
<b>Notice:</b>	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971). During the rotating measurement it is not possible to save the parameter (p0971).		
<b>Note:</b>	When the rotating measurement is activated, it is not possible to save the parameters (p0971). Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made. The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s.

<b>Description:</b>	Sets the reference quantity for speed and frequency. All speeds or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The following applies: Reference frequency (in Hz) = reference speed (in ((rpm) / 60) x pole pair number)		
<b>Dependency:</b>	This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. <b>Notice:</b>	When the reference speed / reference frequency is changed, short-term communication interruptions may occur.		
<b>Note:</b>	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. 	10 [Vrms]	100000 [Vrms]	1000 [Vrms]
<b>Description:</b>	Sets the reference quantity for voltages. All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC link voltage. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). Note: This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.		
<b>Dependency:</b>	p2001 is only updated during automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning has been carried out first for drive data set zero and as a result overwriting of the parameter has not been blocked by setting p0573 = 1. Refer to: r3996		
<b>Notice:</b>	When the reference voltage is changed, short-term communication interruptions may occur.		
<b>Note:</b>	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity. Example: The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.

	0.10 [Arms]	100000.00 [Arms]	100.00 [Arms]
<b>Description:</b>	Sets the reference quantity for currents. All currents specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
<b>Dependency:</b>	This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1. Refer to: r3996		
<b>Notice:</b>	If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor must be taken into account. Example: p2002 = 100 A Reference quantity 100 A corresponds to 100 % p0305[0] = 100 A Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current p0305[1] = 50 A Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current When the reference current is changed, short-term communication interruptions may occur.		
<b>Note:</b>	Pre-assigned value is p0640. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage (p2002 = r0206 / p0210 / 1.73) is pre-assigned as the reference quantity. Example: The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

<b>Dependency:</b>	This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1. Refer to: r3996		
<b>Notice:</b>	When the reference torque is changed, short-term communication interruptions may occur.		
<b>Note:</b>	Preassigned value is 2 * p0333. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example: The actual value of the total torque (r0079) is connected to a test socket (e.g. p0771[0]). The actual torque is cyclically converted into a percentage of the reference torque (p2003) and output according to the parameterized scaling.

**Description:** Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".  
Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

**Value:**  
0: Freeze setpoints and continue to process sign-of-life  
1: Freeze setpoints and sign-of-life  
2: Do not freeze setpoints

**Recommendation:** Do not change the setting p2037 = 0.

**Note:** If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

<b>Description:</b>	Sets the delay time to initiate fault F01910 after a setpoint failure. The time until the fault is initiated can be used by the application. This means that it is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).

<b>Description:</b>	Sets the fault response for the selected fault.		
<b>Value:</b>	0: NONE 1: OFF1 2: OFF2 3: OFF3 5: STOP2 6: Internal armature short-circuit / DC braking		
<b>Dependency:</b>	The fault is selected and the required response is set under the same index. Refer to: p2100		
<b>Notice:</b>	For the following cases, it is not possible to re-parameterize the fault response to a fault: - fault number does not exist (exception value = 0). - Message type is not "fault" (F). - fault response is not permissible for the set fault number.		
<b>Note:</b>	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved. The fault response can only be changed for faults with the appropriate identification. Example: F12345 and fault response = NONE (OFF1, OFF2) --> The fault response NONE can be changed to OFF1 or OFF2. For value = 1 (OFF1): Braking along the ramp-function generator down ramp followed by a pulse inhibit. For value = 2 (OFF2): Internal/external pulse inhibit. For value = 3 (OFF3): Braking along the OFF3 down ramp followed by a pulse inhibit. For value = 5 (STOP2): n_set = 0 For value = 6 (armature short-circuit, internal/DC braking): This value can only be set for all drive data sets when p1231 = 4. a) DC braking is not possible for synchronous motors. b) DC braking is possible for induction motors.

**Note:** For bit 03, 07:  
 These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present" or "alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121).  
 For bit 06, 08:  
 These status bits are used for internal diagnostic purposes only.  
 For bits 11, 12:  
 These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

	<b>Min</b> 0.00 [rpm]	<b>Max</b> 210000.00 [rpm]	<b>Factory setting</b> 0.00 [rpm]
<b>Description:</b>	Sets the upper speed threshold of the stall monitoring of the pump or fan. The lower limit is formed by the speed threshold 1 of the load monitoring (p2182). The stall monitoring is active between p2182 and p2165.		
<b>Dependency:</b>	The following applies: p2182 < p2165 Refer to: A07891, F07894		
<b>Note:</b>	For p2165 = 0 or p2165 < p2182, the following applies: There is no special stall monitoring for the pump/fan, but only the remaining load monitoring functions (e.g. leakage monitoring for a pump) for the pump or fan are active.		
<b>p2168[0...n]</b>	<b>Load monitoring stall monitoring torque threshold / Stall_mon M_thresh</b>

	<b>Min</b> 0.00 [Nm]	<b>Max</b> 20000000.00 [Nm]	<b>Factory setting</b> 10000000.00 [Nm]
<b>Description:</b>	Sets the torque threshold of the stall monitoring of the pump or fan. If, in the monitored speed range from p2182 to p2165, the torque exceeds this threshold, then this is evaluated as either the motor having stalled or heavy-duty starting.		
<b>Dependency:</b>	For pumps, the following applies (p2193 = 4): - the leakage characteristic must lie below the torque threshold for the stall monitoring - the torque threshold for dry running operation must lie below the torque threshold for stall monitoring For fans, the following applies (p2193 = 5): - the torque threshold for the stall monitoring must lie above the torque threshold to identify belt breakage (p2191). Refer to: p2165, p2191 Refer to: A07891, F07894		

## 2 Parameters

### 2.2 List of parameters

**Note:** The following applies for p2168 = 0:  
The special stall monitoring for pump/fan is deactivated.  
Then, only the remaining load monitoring functions (e.g. the leakage monitoring for a pump) for pump or fan are realized.

- Notice:** The following prerequisites must be fulfilled in order to be able to save the setpoint in a non-volatile fashion:
- Firmware with V2.3 or higher.
  - Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).
- Note:** For bit 00:
- 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.  
 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.
- For bit 02:
- 0: Without initial rounding-off  
 1: With initial rounding-off.
- The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).
- It is calculated as follows:
- $$r = 0.0001 \times \max(p2237, |p2238|) [\%] / 0.13^2 [s^2]$$
- The jerk is effective until the maximum acceleration is reached ( $a_{max} = p2237 [\%] / p2247 [s]$  or  $a_{max} = p2238 [\%] / p2248 [s]$ ), after which the drive continues to run linearly with constant acceleration.
- The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.
- For bit 03:
- 0: Non-volatile data save deactivated.  
 1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).
- For bit 04:
- When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

	06	Internal controller limit not displayed	Yes	No	-
<b>Dependency:</b>	For bit 04 = 0: The setting is only effective when the PID controller is deactivated. Refer to: p2280, p2285				
<b>Caution:</b>	For bit 04 = 1 (p2251 = 0): The PID controller can oscillate if the ramp-up and ramp-down times of the speed setpoint channel are not taken into account when setting controller parameters p2280 and p2285.				
					
<b>Note:</b>	For bit 04 = 0 (only for p2251 = 0): The ramp-function generator in the speed setpoint channel is bypassed when the technology controller is operational. As a consequence, ramp times p1120, p1121 are not taken into consideration when configuring the controller. For bit 04 = 1 (only for p2251 = 0): The ramp-function generator in the speed setpoint channel is not bypassed when the technology controller is operational. As a consequence, the ramp-up and ramp-down times (p1120, p1121) remain effective, and must be taken into account as controlled system variables when setting the PID controller parameters (p2280, p2285). The enable ramps of the PID controller are ensured in this setting by p1120, p1121 as well as rounding functions p1130 and p1131. The ramp-up/ramp-down time of the PID controller limiting p2293 must be set appropriately shorter, as otherwise this has an impact on the speed setpoint channel. For bit 05 = 0: The integral component of the PID controller is held if a skip band or the minimum speed range is passed through in the speed set point channel. This prevents the speed from oscillating between the edges of the skip band. For bit 05 = 1: The setting is only effective if a skip band is no longer active. The integral component of the PID controller is not held in the range of the skip speeds. The skip band is passed through even for small system deviations and low controller gain factors. In so doing, the controller integral time must be selected large enough so that no undesirable speed oscillations occur between the skip band edges. The influence of a minimum speed p1080 on the integration behavior can be reduced by raising the lower PID controller limit to p1080 / p2000 * 100%. For bit 06 = 1: In r2349, bit 10 and bit 11 are not displayed when reaching internal limits (e.g. for OFF1/3).

<b>Description:</b>	Sets the integral time (I component, integrating time constant) of the technology controller.

This is necessary in order to prevent the controller from behaving in an unstable manner, as the ramp-function generator switches to the parameterized up and down ramps (p1120, p1121) at the same time in order to avoid setpoint steps. This state can be exited or avoided by changing the controller setpoint or by using the start speed (= minimum speed).		
<b>Note:</b>	When the controller output reaches the limit, the I component of the controller is held. p2285 = 0: The integral time is disabled and the I component of the controller is reset.

<b>Description:</b>	Sets the start value for the output of the technology controller. If the drive is switched on and the technology controller is already enabled (see p2200, r0056.3), then its output signal r2294 first goes to the start value p2302, before the controller starts to operate.		

**Dependency:** The starting value is only effective in the mode "technology controller as main speed setpoint" (p2251 = 0).  
If the technology controller is first enabled when the drive is switched on, a start speed remains ineffective, and the controller output starts with the actual setpoint speed of the ramp-function generator.

**Note:** If the technology controller operates on the speed/setpoint channel (p2251 = 0), then the starting value is interpreted as the starting speed and when operation is enabled, is connected to the output of the technology controller (r2294).  
If fault F07426 "technology controller actual value limited" occurs while ramping up to the starting value and if the associated reaction has been set to "NONE" (see p2100, p2101), the starting value is kept as the speed setpoint instead of a switch to closed-loop control operation.

**Description:** Setting to invert the system deviation of the technology controller.  
The setting depends on the type of control loop.

**Value:** 0: No inversion  
1: Inversion

**Caution:**  If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!

**Note:** The correct setting can be determined as follows:  
- inhibit the technology controller (p2200 = 0).  
- increase the motor speed and in so doing, measure the actual value signal (of the technology controller).  
- if the actual value increases with increasing motor speed, then the inversion should be switched out.  
- if the actual value decreases with increasing motor speed, then the inversion should be set.  
If value = 0:  
The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor).  
If value = 1:  
The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

**Description:** Sets the threshold value for the system deviation of the technology controller, which controls holding the controller integral component in the range of the skip speeds of the ramp-function generator.

**Recommendation:** To avoid speed setpoint steps in the range of the skip speeds, we recommend setting p2252 bit 4 = 1 (ramp-function generator bypass deactivated).

**Dependency:** The parameter has no effect for p2252 bit 5 = 1 (integrator hold deactivated).  
Refer to: r2273

**Note:** Only p2251 = 0:  
If the output signal of the technology controller reaches a skip band in the speed setpoint channel, then the integral component of the controller is held, if at the same time, the system deviation is lower than the threshold value set here. By holding the integral component, it can be avoided that the controller oscillates in the range of the skip bands.

<b>Description:</b>	Sets the response of the technology controller to the occurrence of fault F07426 (technology controller actual value limited). The fault response is executed if status bit 8 or 9 in the technology controller status word r2349 is set. If both status bits are zero, a switch back to technology controller operation will follow.		
<b>Value:</b>	0: Function inhibited 1: On fault: Changeover to r2344 (or p2302) 2: On fault: Changeover to p2215		
<b>Dependency:</b>	The parameterized fault response is only effective if the technology controller mode is set to p2251 = 0 (technology controller as main setpoint). Refer to: p2267, p2268, r2344 Refer to: F07426		
<b>Notice:</b>	Dependent upon the application, the changing over of the setpoint when fault F07426 occurs can lead to the fault condition disappearing and the re-activation of the technology controller. This can repeat itself and cause limit oscillations. In this case, a different fault response or a different fixed setpoint 15 for the fault response p2345 = 2 should be selected.		
<b>Note:</b>	The parameterized fault response can only be achieved if the default fault response of the technology controller fault F07426 is set to "NONE" (see p2100, p2101). If a fault response other than "NONE" is entered in p2101 for F07426, p2345 must be set to zero. If the fault occurs during ramping up to the starting setpoint p2302, this starting setpoint is retained as the final value (there is no changeover to the fault response setpoint).

**Description:**

Activates the function to automatically tune the PID controller.

**Value:**

- 0: PID autotuning deactivated
- 1: PID autotuning with ZN technique
- 2: As 1 with low overshoot
- 3: As 2 + low or no overshoot
- 4: PID autotuning, only PI

**Dependency:**

Active if the PID controller is enabled (see p2200).

**Note:**

P2350 = 1

This is the Ziegler-Nichols standard tuning (ZN tuning). In this case, it should involve a response to a step.

p2350 = 2

For this tuning, a low overshoot is obtained (O/S). However, it should be faster than option 1.

p2350 = 3

For this tuning, a low or no overshoot is obtained. However, it is not as fast as option 2.

p2350 = 4

For this tuning, only values P and I are changed, and it should involve a dampened response.

Which option should be selected depends on the particular application. It can be generally stated that option 1 manifests a good response. However, if a faster response is required, then option 2 should be selected.

If no overshoot is desirable, then option 3 should be the preferred choice.

Option 4 should be selected for cases in which no D component is required.

The tuning technique is identical for all options.

Only the P, I and D values are calculated differently.

This parameter is set to zero after automatic tuning has been completed.

**Note:**

For bit 00:  
Hardware or software malfunction was identified. Carry out a POWER ON of the component involved. If it occurs again, contact Technical Support.

For bit 01:  
A line supply fault has occurred (phase failure, voltage level, ...). Check the line supply / fuses. Check the supply voltage. Check the wiring.

For bit 02:  
The DC link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.

For bit 03:  
An inadmissible operating state of the power electronics was identified (overcurrent, overtemperature, IGBT failure, ...). Check that the permissible load cycles are maintained. Check the ambient temperatures (fan).

For bit 04:  
The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet cooling.

For bit 05:  
A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor.

For bit 06:  
The motor was operated outside the permissible limits (temperature, current, torque, ...). Check the load cycles and limits that have been set. Check the ambient temperature / motor cooling.

For bit 07:

The communication to the higher-level control system (internal coupling, PROFIBUS, PROFINET, ...) is faulted or interrupted. Check the state of the higher-level control system. Check the communication connection/wiring. Check the bus configuration / clock cycles.

For bit 08:

A safety operation monitoring function (Safety) has detected an error.

For bit 09:

When evaluating the encoder signals (track signals, zero marks, absolute values, ...) an illegal signal state was detected. Check the encoder / state of the encoder signals. Observe the maximum frequencies.

For bit 10:

The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant design. Observe the maximum permissible quantity structure / clock cycles.

For bit 11:

The infeed is faulted or has failed. Check the infeed and the surroundings (line supply, filter, reactors, fuses, ...). Check the closed-loop infeed control.

For bit 15:

Group fault. Determine the precise cause of the fault using the commissioning tool.

	05	Minus limit switch reached	Yes	No	-
<b>Dependency:</b>	Refer to: p3340, p3342, p3343				
<b>Note:</b>	For bit 00 = 1: The limit switch enables motion. For example, this bit can be used for interconnection with binector input p0840 (ON/OFF1). For bit 01 = 0: The drive cannot be moved as a result of the limit switch function (e.g. as a result of the switching-on inhibited). For example, this bit can be used for interconnection with binector input p0848 (OFF3). For bit 02 = 1: The axis is at zero speed.				

## 2 Parameters

### 2.2 List of parameters

For bit 04 = 1:  
The plus limit switch reached.  
For bit 05 = 1:  
The minus limit switch reached.

<b>Value:</b>	0: Friction characteristic record deactivated 1: Friction char record activated for all directions 2: Friction char record activated for positive direction 3: Friction char record activated for negative direction			
<b>Dependency:</b>	When selecting the friction characteristic measurement, the drive data set changeover is suppressed. For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.			
<b>Danger:</b>	For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.			
				
<b>Notice:</b>	To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).			

**Note:** When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).  
 When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.  
 When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.

<b>p3856[0...n]</b>	<b>Compound braking current / Compound I_brake</b>

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [%]	250.00 [%]	0.00 [%]
<b>Description:</b>	Compound braking current is used to define the amount of DC current that is produced on stopping the motor during U/f operation to further increase the DC braking function. Compound braking is a superimposition of the DC braking function with regenerative braking (net braking along the ramp) after OFF1 or OFF3. This permits braking with controlled motor frequency and minimum power input into the motor. Effective braking without using additional hardware components is obtained by optimizing the ramp down time and compound braking.		
<b>Dependency:</b>	The compound braking current is only activated if the DC link voltage exceeds the threshold value in r1282. Compound braking does not operate in the following cases: <ul style="list-style-type: none"> <li>- DC braking activated (p1230, r1239).</li> <li>- motor is still not magnetized (e.g. for flying restart).</li> <li>- vector control parameterized (p1300 &gt;= 20).</li> <li>- synchronous motor used (p0300 = 2xx).</li> </ul>		
<b>Notice:</b>	Generally, increasing the braking current improves the braking effect when stopping the motor. However, if the value is set too high, then the drive can be tripped (shut down) as a result of overcurrent or ground fault. Recommendation: $p3856 < 100 \% \times (r0209 - r0331) / p0305 / 2$ Compound braking generates a current in the motor with a ripple manifesting the rotational frequency. The higher the braking current is set, the higher the resulting ripple, especially when the Vdc_max control is simultaneously active (refer to p1280).		

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter value is entered relative to the rated motor current (p0305).  
Compound braking is deactivated with p3856 = 0%.

**Description:** Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning.

p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning.

The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p15 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1).

p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p15 and p1500 and the calculations corresponding to p0340 = 1.

p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1.

**Value:**

- 0: No quick parameterization
- 1: Quick parameterization after parameter reset
- 2: Quick parameterization (only) for BICO and motor parameters
- 3: Quick parameterization for motor parameters (only)

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** When the calculations have been completed, p3900 and p0010 are automatically reset to a value of zero.

When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten.

If a catalog motor has not been selected (p0300), then the following parameters are reset with p3900 > 0 in order to restore the situation that applied when commissioning the drive for the first time:

induction motor: p0320, p0352, p0362 ... p0369, p0604, p0605

synchronous motor: p0352, p0604, p0605

	02	Load adaptation Kp	Yes	No	-
	06	Do not change Kp	Yes	No	-

**Dependency:** Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

**Note:** For bit 00: For significant differences between the motor and load moment of inertia, or for low dynamic performance of the controller, then the P controller becomes a PD controller in the position control loop. As a consequence, the dynamic performance of the position controller is increased.  
This function should only be set when the speed precontrol (bit 3 = 1) or the torque precontrol (bit 4 = 1) is active.

For bit 01: At low speeds, the controller gain factors are automatically reduced in order to avoid noise and oscillation at standstill.

For bit 02: The estimated load moment of inertia is taken into account for the speed controller gain (see p5273).

For bit 03: Activates the speed precontrol for the basic positioner (EPOS).

For bit 04:

Activates the torque pre-control for the basic positioner (EPOS).

For bit 05:

The maximum setpoint acceleration for the basic positioner (EPOS) is determined based on the estimated moment of inertia. This is realized by activating the bit once.

The prerequisite is that the drive pulses are inhibited, and the moment of inertia was previously determined.

For bit 06:

The speed controller gain set in p1460 is not changed when calculating the controller data.

<b>Dependency:</b>	Refer to: p7761, p7765, p7766, p7767, p7768				
<b>Note:</b>	KHP: Know-How Protection For bit 00: Write protection can be activated/deactivated via p7761 on the Control Unit. For bit 01: The know-how protection can be activated by entering a password (p7766 ... p7768). For bit 02: If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.				

For bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and p7765 bit 00 is set.

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and in p7765 bit 01 is set and not bit 00.

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and in p7765.2 is set.

When using the STARTER commissioning software, the password should be entered using the associated dialogs.

The following rules apply when entering the password:

- password entry must start with p7766[0].

- no gaps are permissible in the password.

- entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

<b>Description:</b>	Displays the Pre-defined Error Field of the CAN node. It includes the number of all errors that have occurred, the number of errors that have occurred for each drive and the errors according to their history. The first 16 bits represent the CANopen error code and the second 16 bits the SINAMICS error code. Index 1 has the same structure - however, the drive object ID is in the second 16 bits instead of the SINAMICS error code. CANopen error code: 0000 hex: No error present. 8110 hex: Alarm A08751 present. 8120 hex: Alarm A08752 present. 8130 hex: Alarm A08700(F) with alarm value = 2 present. 1000 hex: Generic error 1 present (there is at least one fault outside the range 8700 ... 8799) 1001 hex: Generic error 2 present (there is at least one alarm in the range 8700 ... 8799 with the exception of A08751, A08752, A08700) All drive objects are acknowledged by writing the value 0 to index 0. As soon as a fault has been acknowledged or an alarm cleared, then it is also cleared from the fault list.			
<b>Index:</b>	[0] = Number of all faults in the drive unit [1] = Most recent drive number / fault number [2] = Number of faults drive 1 [3] = Fault 1/ drive 1 [4] = Fault 2/ drive 1 [5] = Fault 3/ drive 1 [6] = Fault 4/ drive 1 [7] = Fault 5/ drive 1 [8] = Fault 6/ drive 1

<b>Description:</b>	Display or setting of the CANopen Node ID. The Node ID can be set as follows: 1) Using the address switch on the Control Unit. --> p8620 can then only be read and displays the selected Node ID. --> A change only becomes effective after a POWER ON. --> CANopen Node ID and PROFIBUS address are identical. 2) Using p8620 --> Only if address 0 is set using the address switch. --> the Node ID is set as standard to 126. --> A change only becomes effective after save and POWER ON.			
<b>Dependency:</b>	Refer to: r8621			
<b>Note:</b>	Every node ID change only becomes effective after a POWER ON. The active node ID is displayed in r8621. The parameter is not influenced by setting the factory setting. For bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

For bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

<b>Note:</b>	The following BICO interconnections are automatically established if the CANopen control word is mapped at one of the locations x = 0 ... 3 in the receive process data buffer. BI: p0840.0 = r209x.0 BI: p0844.0 = r209x.1 BI: p0848.0 = r209x.2 BI: p0852.0 = r209x.3 BI: p2103.0 = r209x.7 The write access is rejected if a CANopen control word is not mapped at one of these locations. This also causes the project download of the commissioning software to be canceled.

**Description:** Setting and display when memory card is "removed safely".  
Procedure:  
Setting p9400 = 2 results in a value of 3  
--> The memory card can be removed safely. After removal the value sets itself to 0 automatically.  
Setting p9400 = 2 results in a value of 100  
--> The memory card cannot be removed safely. Removal may destroy the file system on the memory card. It may be necessary to set p9400 = 2 again.

**Value:** 0: No memory card inserted  
1: Memory card inserted  
2: Request "safe removal" of the memory card  
3: "Safe removal" possible  
100: "Safe removal" not possible due to access

**Dependency:** Refer to: r9401

**Notice:** Removing the memory card without a request (p9400 = 2) and confirmation (p9400 = 3) may destroy the file system on the memory card. The memory card will then no longer work properly and must be replaced.

**Note:** The status when the memory card is being "removed safely" is shown in r9401.  
For value = 0, 1, 3, 100:  
These values can only be displayed, not set.

**Note:**

For bit 01, 00:  
 Bit 1/0 = 0/0: No memory card inserted (corresponds to p9400 = 0).  
 Bit 1/0 = 0/1: "Safe removal" possible (corresponds to p9400 = 3).  
 Bit 1/0 = 1/0: Status not possible.  
 Bit 1/0 = 1/1: Memory card inserted (corresponds to p9400 = 1, 2, 100).

For bit 02, 00:  
 Bit 2/0 = 0/0: No memory card inserted.  
 Bit 2/0 = 0/1: Memory card inserted, but not a SIEMENS memory card.  
 Bit 2/0 = 1/0: Status not possible.  
 Bit 2/0 = 1/1: SIEMENS memory card inserted.

## 2 Parameters

### 2.2 List of parameters

**Note:** For bit 00:  
When STO is selected, the cause is displayed in bits 16 ... 21.  
For bit 18:  
When the bit is set, STO is selected via PROFIsafe.  
For bit 19:  
For the drive-integrated motion monitoring functions, due to OFF2, no actual value sensing possible.

## 2 Parameters

### 2.2 List of parameters

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** Rounding effects can occur in the last decimal place of the parameterized time.  
The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the fail-safe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions.  
Example:  
Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.  
Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

## 2.5 Parameters for write protection and know-how protection

### 2.5.1 Parameters with "WRITE\_NO\_LOCK"

The following list contains the parameters with the "WRITE\_NO\_LOCK" attribute.

These parameters are not affected by the write protection.

Product: SINAMICS G120C, Version: 4710100, Language: eng, Type: WRITE\_NO\_LOCK

p0003	Access level / Acc_level
p0010	Drive commissioning parameter filter / Drv comm. par_filt
p0124[0...n]	CU detection via LED / CU detection LED
p0791[0...1]	CO: Fieldbus analog outputs / Fieldbus AO
p0970	Reset drive parameters / Drive par reset
p0971	Save parameters / Save par
p0972	Drive unit reset / Drv_unit reset
p2111	Alarm counter / Alarm counter
p3950	Service parameter / Serv par
p3981	Acknowledge drive object faults / Ackn DO faults
p3985	Master control mode selection / PcCtrl mode select
p7761	Write protection / Write protection
p8805	Identification and maintenance 4 configuration / I&M 4 config
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3

p8808[0...53]	Identification and Maintenance 3 / I&M 3
p8809[0...53]	Identification and Maintenance 4 / I&M 4

p8980	Ethernet/IP profile / Eth/IP profile
p8981	Ethernet/IP ODVA STOP mode / Eth/IP ODVA STOP
p8982	Ethernet/IP ODVA speed scaling / Eth/IP ODVA n scal
p8983	Ethernet/IP ODVA torque scaling / Eth/IP ODVA M scal
p9400	Safely remove memory card / Mem_card rem
p9484	BICO interconnections search signal source / BICO S_src srch

#### 2.5.3 Parameters with "KHP\_ACTIVE\_READ"

The following list contains the parameters with the "KHP\_ACTIVE\_READ" attribute.

These parameters can also be read with activated know-how protection.

Product: SINAMICS G120C, Version: 4710100, Language: eng, Type: KHP\_ACTIVE\_READ

p0015	Macro drive unit / Macro drv unit
p0100	IEC/NEMA mot stds / IEC/NEMA mot stds
p0170	Number of Command Data Sets (CDS) / CDS count
p0180	Number of Drive Data Sets (DDS) / DDS count
p0300[0...n]	Motor type selection / Mot type sel
p0304[0...n]	Rated motor voltage / Mot U_rated
p0305[0...n]	Rated motor current / Mot I_rated
p0505	Selecting the system of units / Unit sys select
p0595	Technological unit selection / Tech unit select
p0730	BI: CU signal source for terminal DO 0 / CU S_src DO 0
p0731	BI: CU signal source for terminal DO 1 / CU S_src DO 1
p0806	BI: Inhibit master control / PcCtrl inhibit
p0870	BI: Close main contactor / Close main cont
p0922	PROFIdrive PZD telegram selection / PZD telegr_sel
p1080[0...n]	Minimum speed / n_min
p1082[0...n]	Maximum speed / n_max
p1520[0...n]	CO: Torque limit upper / M_max upper
p2000	Reference speed reference frequency / n_ref f_ref
p2001	Reference voltage / Reference voltage
p2002	Reference current / I_ref
p2003	Reference torque / M_ref
p2006	Reference temperature / Ref temp
p2030	Field bus interface protocol selection / Field bus protocol
p2038	PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode
p2079	PROFIdrive PZD telegram selection extended / PZD telegr ext
p7763	KHP OEM exception list number of indices for p7764 / KHP OEM qty p7764
p7764[0...n]	KHP OEM exception list / KHP OEM excep list
p9601	SI enable functions integrated in the drive (processor 1) / SI enable fct P1
p9810	SI PROFIsafe address (processor 2) / SI PROFIsafe P2

## 2.6 Quick commissioning (p0010 = 1)

The parameters required for the quick commissioning (p0010 = 1) are shown in the following table:

Table 2-7 Quick commissioning (p0010 = 1)

Par. no.	Name	Access level		Can be changed
p0010	Drive, commissioning parameter filter	1		C(1)T
p0015	Macro drive unit	1		C(1)
p0096	Application class	1		C(1)
p0100	IEC/NEMA mot stds	1		C(1)
p0205	Power unit application	1		C(1,2)
p0230	Drive filter type, motor side	1		C(1,2)
p0300	Motor type selection	2		C(1,3)
p0301	Motor code number selection	2		C(1,3)
p0304	Rated motor voltage	1		C(1,3)
p0305	Rated motor current	1		C(1,3)
p0306	Number of motors connected in parallel	1		C(1,3)
p0307	Rated motor power	1		C(1,3)
p0308	Rated motor power factor	1		C(1,3)
p0309	Rated motor efficiency	1		C(1,3)
p0310	Rated motor frequency	1		C(1,3)
p0311	Rated motor speed	1		C(1,3)
p0316	Motor torque constant	4		C(1,3)UT
p0322	Maximum motor speed	1		C(1,3)
p0323	Maximum motor current	1		C(1,3)
p0335	Motor cooling type	2		C(1,3)T
p0500	Technology application	2	G120C CAN G120C DP G120C USS/MB G120C PN	C(1,5)T
p0500	Technology application	4	G120C PN	C(1,5)T
p0640	Current limit	2		C(1,3)UT
p0922	PROFIdrive telegram selection	1		C(1)T
p0970	Reset drive parameters	1		C(1,30)
p1080	Minimum speed	1		C(1)T
p1082	Maximum rotation speed	1		C(1)T
p1120	Ramp-function generator ramp-up time	1		C(1)UT
p1121	Ramp-function generator ramp-down time	1		C(1)UT
p1135	OFF3 ramp-down time	2		C(1)UT

Table 2-7 Quick commissioning (p0010 = 1), continued

Par. no.	Name	Access level		Can be changed
p1300	Open-loop/closed-loop control operating mode	2		C(1)T
p1900	Motor data identification and rotating measurement	2		C(1)T
p1905	Parameter tuning selection	1		C(1)T
p3900	Completion of quick commissioning	1		C(1)

If p0010 = 1 is selected, p0003 (user access level) can be used to select the parameters that are to be accessed.

At the end of the quick commissioning, set p3900 = 1 to perform the required motor calculations and reset all other parameters (not included in p0010 = 1) to their default settings.

### Symbols for computational and closed-loop control functions

**Threshold value switch 1/0**  
Outputs at y a logical "1" if  $x < S$ .

**Threshold value switch 0/1**  
Outputs at y a logical "1" if  $x > S$ .

**Threshold value 1/0 with hysteresis**  
Outputs a logical "1" at y if  $x < S$ .  
If  $x \geq S + H$  then y returns to 0.

**Threshold value 0/1 with hysteresis**  
Outputs a logical "1" at y if  $x > S$ .  
If  $x \leq S - H$  then y returns to 0.

**Limiter**  
x is limited to the upper limit LU and the lower limit LL and output at y.  
The digital signals MLU and MLL have the value "1", if the upper or lower limit is active.

**Sample & Hold element**  
Sample and hold element.  
 $y = x$  if SET = 1  
(not retentively saved at POWER OFF)

### Symbols for logic functions

**NOT element**  
Logical inversion (negation)

**AND element**  
with logical inversion of an input

**OR element**

**Exclusiv-OR/XOR**  
 $y = 1$  when  $x_1 \neq x_2$  is.

**Comparator**  
 $y = 1$  when  $x_1 = x_2$  is.

**R/S flip-flop**  
S = setting input  
R = reset input  
Q = non-inverted output  
Q-bar = inverted output

### Symbols for computational and closed-loop control functions

**Sign reversal**  
 $y = -x$

**Absolute value generator**  
 $y = |x|$

**Divider**  
 $y = \frac{x_1}{x_2}$

**Multiplier**  
 $y = x_1 \cdot x_2$

**Comparator greater than 0**  
 $y = 1$ , if the analog signal  $x > 0$ , i.e. is positive.

**Differentiator**  
 $y = \frac{dx}{dt}$

### Handling BICO technology

**Binector:**  Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

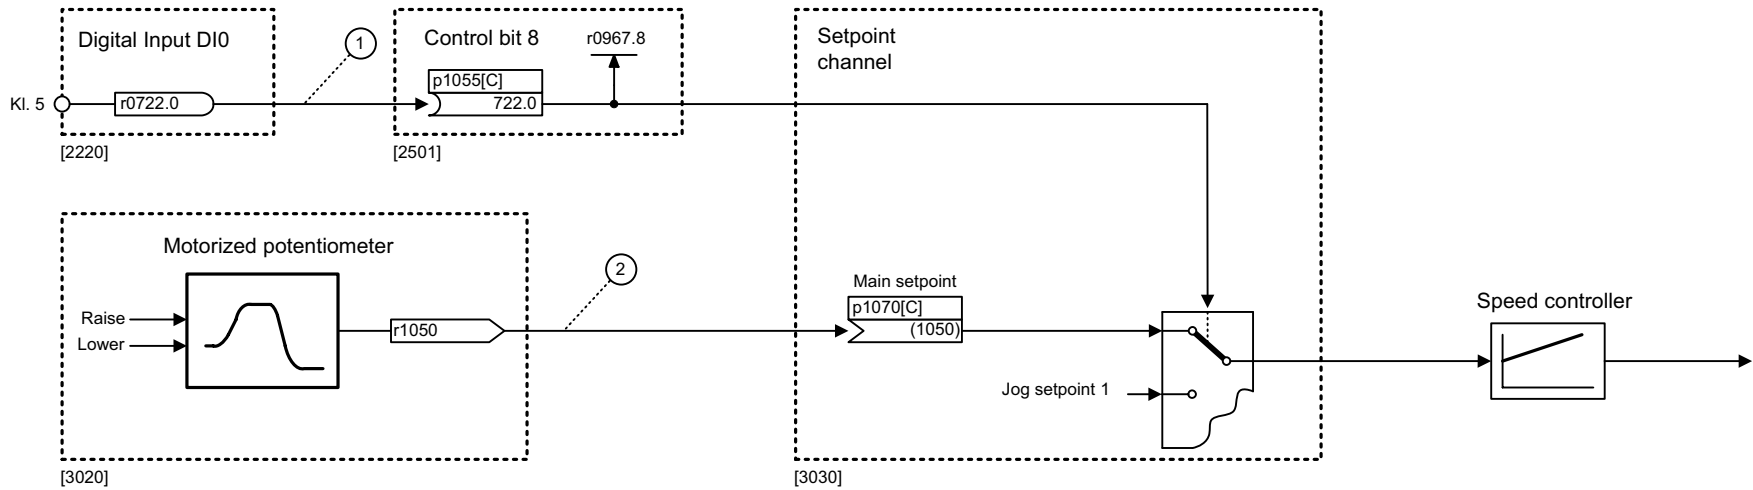

**Connector:**  Connectors are "analog signals" that can be freely interconnected (e.g. percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

**Parameterization:**

At the signal destination, the required binector or connector is selected using appropriate parameters:  
 "BI:" parameter for binectors (BI = Binector Input)  
 or  
 "CI:" parameter for connectors (CI = Connector Input)

**Example:**

The main setpoint for the Speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from Digital Input DI0 (BO: r0722.0, Terminal 5 (Kl. 5)) on the CU.

**Parameterizing steps:**

- ① p1055[0] = 722.0 Terminal 5 (Kl. 5) acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

<1> Differential Input!  
For an input signal referred to ground, terminal 4 must be connected to reference potential M.  
Notice:  
The voltage between inputs and between input and the ground point must not exceed 35 V.  
When the load resistor is switched in (DIP switch in position ↑), the voltage between the input terminals must not exceed 10 V or the impressed current 80 mA. If this is not observed the input will be damaged.

<2> For p0756 = 2, 3 the units are mA.  
For p0756 = 0, 1, 4 the units are V.

- <2> If p1215 = 0, 2 -> t = 0 ms.
- <3> Only if "Safety Integrated" is active.
- <4> Monitoring time is initialized in dependence on the rated power of Power Module.
- <5> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
- <6> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or switching on inhibited), r0046.21 = 1, if p0858 = 1 or p0856 = 0. The signal generation is shown simplified.
- <7> The internal signal includes signals that lead to OFF1 or OFF3 (e. g. BICO or fault response).
- <8> If the brake is permanently applied or released (p0855, p0858 or p1215) the drive does not wait while the brake is released or applied.
- <9> Start frequency with U/f control: p1351, p1352 [6310.6]; Start torque with vector control: p1475 [6040.3].

4.2	List of faults and alarms	641

## 4.1 Overview of faults and alarms

### 4.1.1 General

#### Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET
- Display online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

#### Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> <li>• The appropriate fault response is triggered.</li> <li>• Status signal ZSW1.3 is set.</li> <li>• The fault is entered in the fault buffer.</li> </ul> <p>How are faults eliminated?</p> <ul style="list-style-type: none"> <li>• Remove the original cause of the fault.</li> <li>• Acknowledge the fault.</li> </ul>
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> <li>• Status signal ZSW1.7 is set.</li> <li>• The alarm is entered into the alarm buffer.</li> </ul> <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> <li>• Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.</li> </ul>

## Fault reactions

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	<p>No response when a fault occurs.</p> <p><b>Note</b></p> <p>With "Basic positioner" (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p><b>Closed loop speed control (p1300 = 20, 21)</b></p> <ul style="list-style-type: none"> <li>• n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121).</li> <li>• When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires.</li> </ul> <p>Zero speed is detected if the actual speed drops below the threshold in p1226 or if the monitoring time (p1227) started when speed setpoint &lt;= speed threshold (p1226) has expired.</p> <p><b>Torque control (p1300 = 22, 23)</b></p> <ul style="list-style-type: none"> <li>• The following applies for closed-loop torque control: Reaction as for OFF2.</li> <li>• When the system switches to closed-loop torque control with p1501, the following applies: No separate braking reaction.</li> </ul> <p>If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</p>
OFF1_ DELAYED	-	As for OFF1, however delayed	<p>Faults with this fault response only become effective after the delay time in p3136 has expired.</p> <p>The remaining time up to OFF1 is displayed in r3137.</p>
OFF2	COAST STOP	Internal/external pulse disable	<p><b>Closed-loop speed and torque control</b></p> <ul style="list-style-type: none"> <li>• Instantaneous pulse suppression, the drive "coasts" to a standstill.</li> <li>• The motor holding brake (if one is being used) is closed immediately.</li> <li>• Switching-on inhibited is activated.</li> </ul>

## 4 Faults and alarms

### 4.1 Overview of faults and alarms

Table 4-2 Fault reactions, continued

List	PROFIdrive	Reaction	Description
OFF3	QUICK STOP	Brake along the OFF3 down ramp followed by pulse disable	<p><b>Closed loop speed control (p1300 = 20, 21)</b></p> <ul style="list-style-type: none"> <li>n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135).</li> <li>When zero speed is detected, the motor holding brake (if parameterized) is closed. The pulses are suppressed when the holding brake's closing time (p1217) expires.</li> </ul> <p>Zero speed is detected if the actual speed drops below the threshold in p1226 or if the monitoring time (p1227) started when speed setpoint &lt;= speed threshold (p1226) has expired.</p> <ul style="list-style-type: none"> <li>Switching-on inhibited is activated.</li> </ul> <p><b>Torque control (p1300 = 22, 23)</b></p> <ul style="list-style-type: none"> <li>Changeover to speed-controlled operation and other reactions as described for speed-controlled operation.</li> </ul>
STOP2	-	n_set = 0	<ul style="list-style-type: none"> <li>n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135).</li> <li>The drive remains in closed-loop speed control.</li> </ul>
IASC/ DCBRAKE	-	-	<ul style="list-style-type: none"> <li>For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed.</li> <li>For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1230 to p1239).</li> </ul>

## Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been eliminated.

Table 4-3 Acknowledging faults

Acknowledgment	Description
POWER ON	<p>The fault is acknowledged by a POWER ON (switch drive unit off and on again).</p> <p><b>Note</b> If this action has not removed the fault cause, the fault is displayed again immediately after power up.</p>
IMMEDIATELY	<p>Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows:</p> <p>1 Set acknowledgment by parameter: p3981 = 0 --&gt; 1</p> <p>2 Acknowledging via binector inputs:</p> <p>p2103            BI: 1. Acknowledge faults p2104            BI: 2. Acknowledge faults p2105            BI: 3. Acknowledge faults</p> <p>3 Acknowledging via a PROFIdrive control signal: STW1.7 = 0 --&gt; 1 (edge)</p> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>• These faults can also be acknowledged by a POWER ON operation.</li> <li>• If this action has not eliminated the fault cause, the fault will continue to be displayed after acknowledgment.</li> <li>• Safety Integrated faults The "Safe Torque Off" (STO) function must be deselected before these faults are acknowledged.</li> </ul>
PULSE SUPPRESSION	<p>The fault can only be acknowledged when the pulses are inhibited (r0899.11 = 0). The same options are available for acknowledging as described under IMMEDIATE acknowledgment.</p>

### 4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms (Page 641)" has the following layout:

<b>Fxxxxx (A, N)</b>	<b>Fault xxxxx (report type can be changed to A or N)</b>
<b>Nxxxxx</b>	<b>No message</b>
<b>Nxxxxx (A)</b>	<b>No message (message type can be changed to A)</b>
<b>Cxxxxx</b>	<b>Safety message (separate message buffer)</b>

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

---

**Note**

You can change the default properties of a fault or alarm by setting parameters.

The "List of faults and alarms (Page 641)" supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

---

**Fault location (optional): Name**

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

**Message class:**

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces (Page 636)". In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)  
Specifies the "Channel error type" of the PROFINET channel diagnostics.  
When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)  
Specifies the bit number in data set DS1 of the diagnostic alarm for SIMATIC S7.  
When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)  
Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.  
When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.
- ET 200 (dec)  
Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.  
When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.
- NAMUR (r3113.x)  
Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

### 4.1 Overview of faults and alarms

Table 4-4 Message classes and coding of various diagnostic interfaces

Text of the message class (number according to PROFIdrive) Cause and remedy.	Diagnostics interface				
	PN (hex)	DS1 (dec)	DP (dec)	ET 200 (dec)	NAMUR (r3113.x)
<b>Hardware/software errors (1)</b> A hardware or software malfunction was detected. Carry out a POWER ON for the relevant component. If it occurs again, contact the hotline.	9000	0	16	9	0
<b>Line fault (2)</b> A line supply fault has occurred (phase failure, voltage level ...). Check the line supply and fuses. Check the supply voltage. Check the wiring.	9001	1	17	24	1
<b>Supply voltage fault (3)</b> An electronics supply voltage fault (48 V, 24 V, 5 V ...) was detected. Check the wiring. Check the voltage level.	9002	2	2 <sup>1</sup> 3 <sup>2</sup>	2 <sup>1</sup> 3 <sup>2</sup>	15
<b>DC-link overvoltage (4)</b> The DC-link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.	9003	3	18	24	2
<b>Power electronics fault (5)</b> An impermissible operating state of the power electronics was detected (overcurrent, overtemperature, IGBT failure ...). Check compliance with the permissible load cycles. Check the ambient temperatures (fan).	9004	4	19	24	3
<b>Overtemperature of the electronic component (6)</b> The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet ventilation.	9005	5	20	5	4
<b>Ground fault / inter-phase short-circuit detected (7)</b> A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor.	9006	6	21	20	5
<b>Motor overload (8)</b> The motor was operated outside the permissible limits (temperature, current, torque ...). Check the load cycles and set limits. Check the ambient temperature / motor cooling.	9007	7	22	24	6
<b>Communication to the higher-level controller faulted (9)</b> The communication to the higher-level controller (internal coupling, PROFIBUS, PROFINET ...) is faulted or interrupted. Check the state of the higher-level controller. Check the communication connection/-wiring. Check the bus configuration/cycles.	9008	8	23	19	7
<b>Safety monitoring channel has detected an error (10)</b> A safe operation monitoring function has detected an error.	9009	9	24	25	8
<b>Actual position/speed value incorrect or not available (11)</b> An illegal signal state was detected while evaluating the encoder signals (track signals, zero marks, absolute values ...). Check the encoder / state of the encoder signals. Observe the maximum permissible frequencies.	900A	10	25	29	9

Table 4-4 Message classes and coding of various diagnostic interfaces, continued

Text of the message class (number according to PROFIdrive) Cause and remedy.	Diagnostics interface				
	PN (hex)	DS1 (dec)	DP (dec)	ET 200 (dec)	NAMUR (r3113.x)
<b>Internal (DRIVE-CLiQ) communication faulted (12)</b> The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant installation. Observe the maximum permissible quantity structures / cycles.	900B	11	26	31	10
<b>Infeed fault (13)</b> The infeed is faulty or has failed. Check the infeed and its environment (line supply, filters, reactors, fuses ...). Check the infeed control.	900C	12	27	24	11
<b>Braking controller / Braking Module faulted (14)</b> The internal or external Braking Module is faulted or overloaded (temperature). Check the connection/state of the Braking Module. Comply with the permissible number of braking operations and their duration.	900D	13	28	24	15
<b>Line filter fault (15)</b> The line filter monitoring has detected an excessively high temperature or another impermissible state. Check the temperature / temperature monitoring. Check the configuration to ensure that it is permissible (filter type, infeed, thresholds).	900E	14	17	24	15
<b>External measured value / signal state outside of the permissible range (16)</b> A measured value / signal state read in via the input area (digital/analog/temperature) has assumed an impermissible value/state. Identify and check the relevant signal. Check the set thresholds.	900F	15	29	26	15
<b>Application / technological function faulty (17)</b> The application / technological function has exceeded a (set) limit (position, velocity, torque ...). Identify and check the relevant limit. Check the setpoint specification of the higher-level controller.	9010	16	30	9	15
<b>Error in the parameterization/configuration/commissioning procedure (18)</b> An error was identified in the parameterization or in a commissioning procedure, or the parameterization does not match the actual device configuration. Determine the precise cause of the fault using the commissioning tool. Adapt the parameterization or device configuration.	9011	17	31	16	15
<b>General drive fault (19)</b> Group fault. Determine the precise cause of the fault using the commissioning tool.	9012	18	9	9	15
<b>Auxiliary unit fault (20)</b> The monitoring of an auxiliary unit (incoming transformer, cooling unit ...) has detected an illegal state. Determine the exact cause of the fault and check the relevant device.	9013	19	29	26	15

1. Undervoltage condition of the electronics power supply
2. Overvoltage condition of the electronics power supply

**Reaction: Default fault reaction (adjustable fault reaction)**

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

---

**Note**

See Table "Fault reactions (Page 631)"

---

**Acknowledgment: Default acknowledgment (adjustable acknowledgment)**

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

---

**Note**

See Table "Acknowledging faults (Page 633)"

---

**Cause:**

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...7] and specifies additional, more precise information about an alarm.

**Remedy:**

Describes the methods available for eliminating the cause of the active fault or alarm.

 <b>WARNING</b>
In certain cases, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

### 4.1.3 Number ranges of faults and alarms

#### Note

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms (Page 641)".

Faults and alarms are organized into the following number ranges:

Table 4-5 Number ranges of faults and alarms

of	To	Area
1000	3999	Control Unit
4000	4999	Reserved
5000	5999	Power section

<b>F01001</b>	<b>FloatingPoint exception</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	An exception occurred during an operation with the FloatingPoint data type. The error may be caused by the basic system or an OA application (e.g. FBLOCKS, DCC). Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting. Note: Refer to r9999 for further information about this fault. r9999[0]: Fault number. r9999[1]: Program counter at the time when the exception occurred. r9999[2]: Cause of the FloatingPoint exception. Bit 0 = 1: Operation invalid Bit 1 = 1: Division by zero Bit 2 = 1: Overflow Bit 3 = 1: Underflow Bit 4 = 1: Inaccurate result
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- carry out a POWER ON (switch-off/switch-on) for all components.</li><li>- check configuration and signals of the blocks in FBLOCKS.</li><li>- check configuration and signals of DCC charts.</li><li>- upgrade firmware to later version.</li><li>- contact Technical Support.</li></ul>

**F01003 Acknowledgment delay when accessing the memory**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A memory area was accessed that does not return a "READY".  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - carry out a POWER ON (switch-off/switch-on) for all components.  
- contact Technical Support.

---

**N01004 (F, A) Internal software error**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An internal software error has occurred.  
Fault value (r0949, hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - read out diagnostics parameter (r9999).  
- contact Technical Support.

**F01005 File upload/download error**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The upload or download of EEPROM data was unsuccessful.  
Fault value (r0949, interpret hexadecimal):  
yyxxxx hex: yy = component number, xxxx = fault cause  
xxxx = 000B hex = 11 dec:  
Power unit component has detected a checksum error.  
xxxx = 000F hex = 15 dec:  
The selected power unit will not accept the content of the EEPROM file.  
xxxx = 0011 hex = 17 dec:  
Power unit component has detected an internal access error.  
xxxx = 0012 hex = 18 dec:  
After several communication attempts, no response from the power unit component.  
xxxx = 008B hex = 140 dec:  
EEPROM file for the power unit component not available on the memory card.  
xxxx = 008D hex = 141 dec:  
An inconsistent length of the firmware file was signaled. It is possible that the download/upload has been interrupted.  
xxxx = 0090 hex = 144 dec:  
When checking the file that was loaded, the component detected a fault (checksum). It is possible that the file on the memory card is defective.  
xxxx = 0092 hex = 146 dec:  
This SW or HW does not support the selected function.  
xxxx = 009C hex = 156 dec:  
Component with the specified component number is not available (p7828).  
xxxx = Additional values:  
Only for internal Siemens troubleshooting.  
**Remedy:** Save a suitable firmware file or EEPROM file for upload or download in folder "/ee\_sac/" on the memory card.

<b>A01009 (N)</b>	<b>CU: Control module overtemperature</b>
<b>Message class:</b>	Overtemperature of the electronic components (6)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check the air intake for the Control Unit.</li><li>- check the Control Unit fan.</li></ul> <p>Note: The alarm is automatically withdrawn once the limit value has been fallen below.</p>
<hr/>	
<b>F01010</b>	<b>Drive type unknown</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	An unknown drive type was found.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- replace Power Module.</li><li>- carry out a POWER ON (switch-off/switch-on).</li><li>- upgrade firmware to later version.</li><li>- contact Technical Support.</li></ul>
<hr/>	
<b>F01015</b>	<b>Internal software error</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	An internal software error has occurred. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- carry out a POWER ON (switch-off/switch-on) for all components.</li><li>- upgrade firmware to later version.</li><li>- contact Technical Support.</li></ul>
<hr/>	
<b>A01016 (F)</b>	<b>Firmware changed</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory. Alarm value (r2124, interpret decimal): 0: Checksum of one file is incorrect. 1: File missing. 2: Too many files. 3: Incorrect firmware version. 4: Incorrect checksum of the back-up file.
<b>Remedy:</b>	For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition. Note: The file involved can be read out using parameter r9925. The status of the firmware check is displayed using r9926.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A01017</b>	<b>Component lists changed</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	On the memory card, one file in the directory /SIEMENS/SINAMICS/DATA or /ADDON/SINAMICS/DATA has been illegally changed with respect to that supplied from the factory. No changes are permitted in this directory. Alarm value (r2124, interpret decimal): zyx dec: x = Problem, y = Directory, z = File name x = 1: File does not exist. x = 2: Firmware version of the file does not match the software version. x = 3: File checksum is incorrect. y = 0: Directory /SIEMENS/SINAMICS/DATA/ y = 1: Directory /ADDON/SINAMICS/DATA/ z = 0: File MOTARM.ACX z = 1: File MOTSRM.ACX z = 2: File MOTSLM.ACX z = 3: File ENCDATA.ACX z = 4: File FILTDATA.ACX z = 5: File BRKDATA.ACX z = 6: File DAT_BEAR.ACX z = 7: File CFG_BEAR.ACX
<b>Remedy:</b>	For the file on the memory card involved, restore the status originally supplied from the factory.

---

<b>F01018</b>	<b>Bootling has been interrupted several times</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	Module booting was interrupted several times. As a consequence, the module boots with the factory setting. Possible reasons for booting being interrupted: - power supply interrupted. - CPU crashed. - parameterization invalid.
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on). After switching on, the module reboots from the valid parameterization (if available). - restore the valid parameterization. Examples: a) Carry out a first commissioning, save, carry out a POWER ON (switch-off/switch-on). b) Load another valid parameter backup (e.g. from the memory card), save, carry out a POWER ON (switch-off/switch-on). Note: If the fault situation is repeated, then this fault is again output after several interrupted boots.

---

<b>A01019</b>	<b>Writing to the removable data medium unsuccessful</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The write access to the removable data medium was unsuccessful.
<b>Remedy:</b>	Remove and check the removable data medium. Then run the data backup again.

---

<b>A01020</b>	<b>Writing to RAM disk unsuccessful</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A write access to the internal RAM disk was unsuccessful.
<b>Remedy:</b>	Adapt the file size for the system logbook to the internal RAM disk (p9930).

---

<b>A01021</b>	<b>Removable data medium as USB data storage medium from the PC used</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The removable data medium is used as USB data storage medium from a PC As a consequence, the drive cannot access the removable data medium. When backing up, the configuration data cannot be saved on the removable data medium. Alarm value (r2124, interpret decimal): 1: The know-how protection as well as the copy protection for the removable data medium is active. Backup is inhibited. 2: The configuration data are only backed up in the Control Unit. See also: r7760 (Write protection/know-how protection status), r9401 (Safely remove memory card status)
<b>Remedy:</b>	Deactivate the USB connection to the PC and back up the configuration data. Note: The alarm is automatically canceled when disconnecting the USB connection or when removing the removable data medium. See also: r9401 (Safely remove memory card status)

---

<b>F01023</b>	<b>Software timeout (internal)</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	An internal software timeout has occurred. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on) for all components. - upgrade firmware to later version. - contact Technical Support.

---

<b>A01028 (F)</b>	<b>Configuration error</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The parameterization that was downloaded was generated with a different module type (Order No., MLFB).
<b>Remedy:</b>	Save parameters in a non-volatile fashion (p0971 = 1).

---

<b>F01030</b>	<b>Sign-of-life failure for master control</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For active PC master control, no sign-of-life was received within the monitoring time. The master control was returned to the active BICO interconnection.
<b>Remedy:</b>	Set the monitoring time higher at the PC or, if required, completely disable the monitoring function. For the commissioning software, the monitoring time is set as follows: <Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds. Notice: The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

---

<b>F01033</b>	<b>Units changeover: Reference parameter value invalid</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	When changing over the units to the referred representation type, it is not permissible for any of the required reference parameters to be equal to 0.0 Fault value (r0949, parameter): Reference parameter whose value is 0.0. See also: p0505 (Selecting the system of units), p0595 (Technological unit selection)
<b>Remedy:</b>	Set the value of the reference parameter to a number different than 0.0. See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

---

<b>F01034</b>	<b>Units changeover: Calculation parameter values after reference value change unsuccessful</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The change of a reference parameter meant that for an involved parameter the selected value was not able to be re-calculated in the per unit representation. The change was rejected and the original parameter value restored. Fault value (r0949, parameter): Parameter whose value was not able to be re-calculated. See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004
<b>Remedy:</b>	- Select the value of the reference parameter such that the parameter involved can be calculated in the per unit representation. - Technology unit selection (p0595) before changing the reference parameter p0596, set p0595 = 1.

---

<b>A01035 (F)</b>	<b>ACX: Parameter back-up file corrupted</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When the Control Unit is booted, no complete data set was found from the parameter back-up files. The last time that the parameterization was saved, it was not completely carried out. It is possible that the backup was interrupted by switching off or withdrawing the memory card. Alarm value (r2124, interpret hexadecimal): ddccbbaa hex: aa = 01 hex: Power up was realized without data backup. The drive is in the factory setting. aa = 02 hex: The last available internal backup data record was loaded. The parameterization must be checked. It is recommended that the parameterization is downloaded again. aa = 03 hex: The last available data record from the memory card was loaded. The parameterization must be checked. aa = 04 hex: An invalid data backup was loaded from the memory card into the drive. The drive is in the factory setting. dd, cc, bb: Only for internal Siemens troubleshooting. See also: p0971 (Save parameters)
<b>Remedy:</b>	- Download the project again with the commissioning software. - save all parameters (p0971 = 1 or "copy RAM to ROM").

---

---

<b>F01036 (A)</b>	<b>ACX: Parameter back-up file missing</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE (OFF1, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	When downloading the device parameterization, a parameter back-up file PSxxxxxy.ACX associated with a drive object cannot be found. Fault value (r0949, interpret hexadecimal): Byte 1: yyy in the file name PSxxxxxy.ACX yyy = 000 --> consistency back-up file yyy = 001 ... 062 --> drive object number yyy = 099 --> PROFIBUS parameter back-up file Byte 2, 3, 4: Only for internal Siemens troubleshooting.
<b>Remedy:</b>	If you have saved the project data using the commissioning software, carry out a new download for your project. Save using the function "Copy RAM to ROM" or with p0971 = 1. This means that the parameter files are again completely written into the non-volatile memory. Note: If the project data have not been backed up, then a new first commissioning is required.

<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	An error has occurred when downloading PSxxxxxy.ACX or PTxxxxxy.ACX files from the non-volatile memory. Fault value (r0949, interpret hexadecimal): Byte 1: yyy in the file name PSxxxxxy.ACX yyy = 000 --> consistency back-up file yyy = 001 ... 062 --> drive object number yyy = 099 --> PROFIBUS parameter back-up file Byte 2: 255: Incorrect drive object type. 254: Topology comparison unsuccessful -> drive object type was not able to be identified. Reasons could be: - incorrect component type in the actual topology - Component does not exist in the actual topology. - Component not active. Additional values: Only for internal Siemens troubleshooting. Byte 4, 3: Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- if you have saved the project data using the commissioning software, download the project again. Save using the function "Copy RAM to ROM" or with p0971 = 1. This means that the parameter files are again completely written to the non-volatile memory. - replace the memory card or Control Unit.

Only for internal Siemens troubleshooting.

**Remedy:**

- check the file attribute of the files (PSxxxxyy.\*\*\*, CAxxxxyy.\*\*\*, CCxxxxyy.\*\*\*) and, if required, change from "read only" to "writeable".
- check the free memory space in the non-volatile memory. Approx. 80 kbyte of free memory space is required for every drive object in the system.
- replace the memory card or Control Unit.

#### **F01040 Save parameter settings and carry out a POWER ON**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** A parameter has been changed that requires the parameters to be backed up and the Control Unit to be switched OFF and ON again.

**Remedy:**

- Save parameters (p0971).
- carry out a POWER ON (switch-off/switch-on) for the Control Unit.

---

#### **F01042 Parameter error during project download**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** An error was detected when downloading a project using the commissioning software (e.g. incorrect parameter value).

For the specified parameter, it was detected that dynamic limits were exceeded that may possibly depend on other parameters.

Fault value (r0949, interpret hexadecimal):

ccbbaaaa hex

aaaa = Parameter

bb = Index

cc = fault cause

0: Parameter number illegal.

1: Parameter value cannot be changed.

2: Lower or upper value limit exceeded.

3: Sub-index incorrect.

4: No array, no sub-index.

5: Data type incorrect.

6: Setting not permitted (only resetting).

7: Descriptive element cannot be changed.

9: Descriptive data not available.

11: No master control.

15: No text array available.

17: Task cannot be executed due to operating state.

20: Illegal value.

21: Response too long.

22: Parameter address illegal.  
 23: Format illegal.  
 24: Number of values not consistent.  
 108: Unit unknown.

Additional values:

Only for internal Siemens troubleshooting.

**Remedy:**

- enter the correct value in the specified parameter.
- identify the parameter that restricts the limits of the specified parameter.

### **F01043 Fatal error at project download**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2 (OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A fatal error was detected when downloading a project using the commissioning software.

Fault value (r0949, interpret decimal):

1: Device status cannot be changed to Device Download (drive object ON?).

2: Incorrect drive object number.

8: Maximum number of drive objects that can be generated exceeded.

11: Error while generating a drive object (global component).

12: Error while generating a drive object (drive component).

13: Unknown drive object type.

14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).

15: Drive status cannot be changed to drive download.

16: Device status cannot be changed to "ready for operation".

18: A new download is only possible if the factory settings are restored for the drive unit.

20: The configuration is inconsistent.

21: Error when accepting the download parameters.

22: SW-internal download error.

100: The download was canceled, because no write requests were received from the commissioning client (e.g. for communication error).

Additional values:

Only for internal Siemens troubleshooting.

**Remedy:**

- use the current version of the commissioning software.
- modify the offline project and download again (e.g. compare the motor and Power Module in the offline project and on the drive).
- change the drive state (is a drive rotating or is there a message/signal?).
- carefully note any other messages/signals and remove their cause.
- boot from previously saved files (switch-off/switch-on or p0970).

### **A01045 Configuring data invalid**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An error was detected when evaluating the parameter files PSxxxxxyy.ACX, PTxxxxyy.ACX, CAxxxxyy.ACX, or CCxxxxyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408.

Alarm value (r2124, interpret hexadecimal):

Only for internal Siemens troubleshooting.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:**

- check the parameters displayed in r9406 up to r9408, and correct these if required.
- Restore the factory setting using (p0970 = 1) and re-load the project into the drive unit.

Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0971 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and the alarm is withdrawn.

#### **A01049**      **It is not possible to write to file**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** It is not possible to write into a write-protected file (PSxxxxx.acx). The write request was interrupted.  
Alarm value (r2124, interpret decimal):  
Drive object number.

**Remedy:** Check whether the "write protected" attribute has been set for the files in the non-volatile memory under .../USER/SINAMICS/DATA/... When required, remove write protection and save again (e.g. set p0971 to 1).

---

#### **F01054**      **CU: System limit exceeded**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** At least one system overload has been identified.

Fault value (r0949, interpret decimal):

1: Computing time load too high (r9976[1]).

5: Peak load too high (r9976[5]).

Note:

As long as this fault is present, it is not possible to save the parameters (p0971).

See also: r9976 (System utilization)

**Remedy:** For fault value = 1, 5:

- reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %.
- check the sampling times and adjust if necessary (p0115, p0799, p4099).
- deactivate function modules.
- deactivate drive objects.
- remove drive objects from the target topology.
- note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology.

When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies:

- the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS).
- if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001).
- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

#### **A01064 (F)**      **CU: Internal error (CRC)**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A checksum error (CRC error) has occurred in the Control Unit program memory

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

<b>A01069</b>	<b>Parameter backup and device incompatible</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The parameter backup on the memory card and the drive unit do not match. The module boots with the factory settings. Example: Devices A and B. are not compatible and a memory card with the parameter backup for device A is inserted in device B.
<b>Remedy:</b>	- insert a memory card with compatible parameter backup and carry out a POWER ON. - insert a memory card without parameter backup and carry out a POWER ON. - if required, withdraw the memory card and carry out POWER ON. - save the parameters (p0971 = 1).

---

<b>F01072</b>	<b>Memory card restored from the backup copy</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective. After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.
<b>Remedy:</b>	Check that the firmware and parameterization is up-to-date.

---

<b>A01073 (N)</b>	<b>POWER ON required for backup copy on memory card</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The parameter assignment on the visible partition of the memory card has changed. In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit. Note: It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).
<b>Remedy:</b>	- carry out a POWER ON (power off/on) for the Control Unit. - carry out a hardware reset (RESET button, p0972).

---

<b>N01101 (A)</b>	<b>CU: memory card not available</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The memory card is not available for the drive.
<b>Remedy:</b>	Insert a memory card. If Starter is not active, interrupt the USB connection to the PC

<b>F01107</b>	<b>Save to memory card unsuccessful</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A data save to the memory card was not able to be successfully carried out. - Memory card is defective. - insufficient space on memory card. Fault value (r0949, interpret decimal): 1: The file on the RAM was not able to be opened. 2: The file on the RAM was not able to be read. 3: A new directory could not be created on the memory card. 4: A new file could not be created on the memory card. 5: A new file could not be written on the memory card.
<b>Remedy:</b>	- try to save again. - replace the memory card or Control Unit.

**F01340**

**Topology: Too many components on one line**

**Message class:**

Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:**

NONE

**Acknowledge:**

IMMEDIATELY

**Cause:**

For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.

Fault value (r0949, interpret hexadecimal):

xyy hex: x = fault cause, yy = component number or connection number.

1yy:

The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all read transfers.

2yy:

The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all write transfers.

3yy:

Cyclic communication is fully utilized.

4yy:

The DRIVE-CLiQ cycle starts before the earliest end of the application. An additional dead time must be added to the control. Sign-of-life errors can be expected.

The conditions of operation with a current controller sampling time of 31.25 µs have not been maintained.

5yy:

Internal buffer overflow for net data of a DRIVE-CLiQ connection.

6yy:

Internal buffer overflow for receive data of a DRIVE-CLiQ connection.

7yy:

Internal buffer overflow for send data of a DRIVE-CLiQ connection.

8yy:

The component clock cycles cannot be combined with one another

900:

The lowest common multiple of the clock cycles in the system is too high to be determined.

901:

The lowest common multiple of the clock cycles in the system cannot be generated with the hardware.

**Remedy:**

- check the DRIVE-CLiQ wiring.

- reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines.

For fault value = 1yy - 4yy in addition:

- increase the sampling times (p0112, p0115, p4099). If necessary, for DCC or FBLOCKS, change the assignment of the run-time group (p21000, p20000) so that the sampling time (r21001, r20001) is increased.

- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

- reduce the function modules (r0108).

- establish the conditions for operation with a current controller sampling time of 31.25 µs (at the DRIVE-CLiQ line, only operate Motor Modules and Sensor Modules with this sampling time and only use a permitted Sensor Module (e.g. SMC20, this means a 3 at the last position of the order number)).

- For an NX, the corresponding Sensor Module for a possibly existing second measuring system should be connected to a free DRIVE-CLiQ socket of the NX.

For fault value = 8yy in addition:

- check the clock cycles settings (p0112, p0115, p4099). Clock cycles on a DRIVE-CLiQ line must be perfect integer multiples of one another. As clock cycle on a line, all clock cycles of all drive objects in the previously mentioned parameters apply, which have components on the line involved.

For fault value = 9yy in addition:

- check the clock cycles settings (p0112, p0115, p4099). The lower the numerical value difference between two clock cycles, the higher the lowest common multiple. This behavior has a significantly stronger influence, the higher the numerical values of the clock cycles.

<b>F01600</b>	<b>SI P1 (CU): STOP A initiated</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive-integrated "Safety Integrated" function on processor 1 has detected an error and initiated a STOP A. - forced checking procedure (test stop) of the safety switch-off signal path on processor 1 unsuccessful. - subsequent response to fault F01611 (defect in a monitoring channel). Fault value (r0949, interpret decimal): 0: Stop request from processor 2. 1005: Pulses suppressed although STO not selected and there is no internal STOP A present. 1010: Pulses enabled although STO is selected or an internal STOP A is present. 1011: Internal fault for the pulse enable in the Power Module. 9999: Subsequent response to fault F01611.
<b>Remedy:</b>	- select Safe Torque Off and de-select again. - carry out a POWER ON (switch-off/switch-on) for all components. - replace Power Module involved. For fault value = 9999: - carry out diagnostics for fault F01611. Note: PM: Power Module STO: Safe Torque Off
<b>F01611 (A)</b>	<b>SI P1 (CU): Defect in a monitoring channel</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE (OFF1, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive-integrated "Safety Integrated" function on processor 1 has detected a fault in the data cross-check between the two monitoring channels and has initiated a STOP F. Fault F01600 (SI P1: STOP A initiated) is output as a consequence of this fault. Fault value (r0949, interpret decimal): 0: Stop request from the other monitoring channel. 1 ... 999: Number of the cross-compared data that resulted in this fault. This number is also displayed in r9795. 2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits. 3: SI F-DI changeover discrepancy time (p9650, p9850). 8: SI PROFIsafe address (p9610, p9810). 9: SI debounce time for STO (p9651, p9851). 1000: Watchdog timer has expired. Within the time of approx. 5 x p9650, alternatively, the following was defined: - the signal at F-DI continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850). - via PROFIsafe, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850). 1001, 1002: Initialization error, change timer / check timer. 1950: Module temperature outside the permissible temperature range. 1951: Module temperature not plausible. 2000: Status of the STO selection for both monitoring channels different. 2001: Feedback signal of safe pulse suppression for both monitoring channels different. 2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850). 2003: Status of the STO terminal for both monitoring channels different. 6000 ... 6166: PROFIsafe fault values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET). For these fault values, the fail-safe control signals (fail-safe values) are transferred to the safety functions. 6000: An internal software error has occurred (only for internal Siemens troubleshooting). 6064 ... 6071: error when evaluating the F parameter. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

---

- 6064: Destination address and PROFIsafe address are different (F\_Dest\_Add).
- 6065: Destination address not valid (F\_Dest\_Add).
- 6066: Source address not valid (F\_Source\_Add).
- 6067: Watchdog time not valid (F\_WD\_Time).
- 6068: Incorrect SIL level (F\_SIL).
- 6069: Incorrect F-CRC length (F\_CRC\_Length).
- 6070: Incorrect F parameter version (F\_Par\_Version).
- 6071: CRC error for the F parameters (CRC1). The transferred CRC value of the F parameters does not match the value calculated in the PROFIsafe driver.
- 6072: F parameterization is inconsistent.
- 6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.
- 6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

**Remedy:**

- For fault values 1 ... 999 described in "Cause":
  - check the cross data comparison that resulted in a STOP F.
  - carry out a POWER ON (switch-off/switch-on).
- For fault value = 1000:
  - check the wiring of the F-DI (contact problems).
  - PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
  - check the discrepancy time, and if required, increase the value (p9650/p9850).
- For fault value = 1001, 1002:
  - carry out a POWER ON (switch-off/switch-on).
- For fault value = 1950, 1951:
  - Operate the Control Unit in the permissible temperature range.
  - replace Control Unit.
- For fault value = 2000, 2001, 2002, 2003:
  - check the discrepancy time F-DI changeover and if required, increase the value (p9650/p9850).
  - check the wiring of the F-DI (contact problems).
  - check the causes of the STO selection in r9772.
- For fault value = 6000:
  - carry out a POWER ON (switch-off/switch-on).
  - upgrade firmware to later version.
  - contact Technical Support.
  - replace Control Unit.
- For fault value = 6064:
  - check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave.
  - check the setting of the PROFIsafe address on processor 1 (p9610) and on processor 2 (p9810).
- For fault value = 6065:
  - check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!
- For fault value = 6066:
  - check the setting of the value in the F parameter F\_Source\_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!
- For fault value = 6067:
  - check the setting of the value in the F parameter F\_WD\_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!
- For fault value = 6068:
  - check the setting of the value in the F parameter F\_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!
- For fault value = 6069:
  - check the setting of the value in the F parameter F\_CRC\_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!
- For fault value = 6070:
  - check the setting of the value in the F parameter F\_Par\_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F\_CRC\_Length and F\_Par\_Version:

F\_CRC\_Length = 2-byte CRC and F\_Par\_Version = 0

F\_CRC\_Length = 3-byte CRC and F\_Par\_Version = 1

For fault value = 6165:

- if the fault occurs after powering up or after inserting the PROFIBUS/PROFINET cable, acknowledge the fault.
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault values that are described in "Cause":

- carry out a POWER ON (switch-off/switch-on).
- contact Technical Support.
- replace Control Unit.

**Remedy:** For fault value = 1:

- set the Safety Integrated password (p9761).

For fault value = 2:

- inhibit Safety Integrated (p9501, p9601) or reset safety parameters (p0970 = 5), then reset the drive parameters again.

For fault value = 3:

- end the simulation mode for the digital input (p0795).

For fault value = 10, 14, 15, 18:

- check whether there are faults in the safety function alignment (F01655, F30655) and if required, carry out diagnostics for the faults involved.
- use a Control Unit that supports the required function.

For fault value = 20:  
- correct the enable setting (p9601).  
For fault value = 21:  
- use a Power Module that supports the Safety Integrated functions.  
For fault value = 26:  
- deactivate the simulation mode for the set signal source for STO (p9620) (p0795).  
- deactivate the simulation mode (p0795) for the F-DIs used by the Safety Integrated functions (r10049, p10006, p10009).  
- For the set test stop of the F-DO with feedback signal input (p10046, p10047), check the simulation mode, and if required, deactivate (p0795).

However, no safety-relevant function has been selected on processor 1 (p9601 = 0). This is the reason that copying is not possible. Note: This fault does not result in a safety stop response. SI: Safety Integrated See also: p9700 (SI copy function)
<b>Remedy:</b>	- Set p9700 to 0. - Check p9601 and if required, correct. - restart the copying function by entering the corresponding value into p9700.

---

<b>A01698 (F)</b>	<b>SI P1 (CU): Commissioning mode active</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The commissioning of the "Safety Integrated" function is selected. This message is withdrawn after the safety functions have been commissioned. Note: - this message does not result in a safety stop response. - in the safety commissioning mode, the "STO" function is internally selected. See also: p0010 (Drive commissioning parameter filter)
<b>Remedy:</b>	Not necessary.

---

<b>A01699 (F)</b>	<b>SI P1 (CU): Test stop for STO required</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The time set in p9659 for the forced checking procedure (test stop) for the "STO" function has been exceeded. A new forced checking procedure is required. After the next time the "STO" function is de-selected, the message is withdrawn and the monitoring time is reset. Note: - this message does not result in a safety stop response. - The test must be performed within a defined, maximum time interval (p9659, maximum of 9000 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). <b>A01788</b>	<b>SI: Automatic test stop waits for STO deselection via motion monitoring functions</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The automatic test stop (forced checking procedure) was not able to be carried out after powering up. Possible causes: - the STO function is selected via safe motion monitoring functions. - a safety message is present, that resulted in a STO. Note: STO: Safe Torque Off
<b>Remedy:</b>	- deselect STO via safe motion monitoring functions. - remove the cause of the safety messages and acknowledge the messages. Note: The automatic test stop is performed after removing the cause.

---

<b>A01790</b>	<b>SI: Power up stopped due to STO via terminals</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When powering up, the automatic internal self test of the Control Unit was not able to be completed as the pulses were not enabled. It is possible that the "STO via terminals at the Power Module" function is being used, and STO is selected in at least one hardware switch-off signal path at the Power Module.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:**

- Deselect STO via the STO terminals at the Power Module (connect STO\_A and STO\_B to 24 V).
- if required, deactivate the "STO via terminals at the Power Module" function via the DIP switch (both DIP switches set to "OFF").

**Note:**

- After the cause has been removed, the Control Unit continues to power up.
- While the alarm remains, a possibly existing brake is kept closed.

STO: Safe Torque Off

**A01796 (F, N) SI P1 (CU): Wait for communication**

**Message class:** Communication error to the higher-level control system (9)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The drive waits for communication to be established to execute the safety-relevant motion monitoring functions.

**Note:**

In this state, the pulses are safely suppressed.

Alarm value (r2124, interpret decimal):

3: Wait for communication to be established to PROFIsafe F-Host.

**Remedy:** If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made:

- check any other PROFIsafe communication messages/signals present and evaluate them.
- check the operating state of the F-Host.
- check the communication connection to the F Host.

**A01900 (F) PROFIBUS: Configuration telegram error**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A PROFIBUS master attempts to establish a connection using an incorrect configuring telegram.

Alarm value (r2124, interpret decimal):

2: Too many PZD data words for input or output. The number of possible PZD is specified by the number of indices in r2050/p2051.

3: Uneven number of bytes for input or output.

211: Unknown parameterizing block.

501: PROFIsafe parameter error (e.g. F\_dest).

**Additional values:**

Only for internal Siemens troubleshooting.

**Remedy:** Check the bus configuration on the master and the slave sides.

For alarm value = 2:  
Check the number of data words for input and output.

For alarm value = 211:  
Ensure offline version <= online version.

For alarm value = 501:  
Check the set PROFIsafe address (p9610).

---

**F01910 (N, A) Fieldbus interface setpoint timeout**

**Message class:** Communication error to the higher-level control system (9)

**Reaction:** OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** The reception of setpoints from the fieldbus interface has been interrupted.

- bus connection interrupted.
- communication partner switched off.

For PROFIBUS:

- PROFIBUS master set into the STOP state.

See also: p2040 (Fieldbus interface monitoring time), p2047 (PROFIBUS additional monitoring time)

**Remedy:** Ensure bus connection has been established and switch on communication partner.  
 - if required, adapt p2040.  
 For PROFIBUS:  
 - set the PROFIBUS master to the RUN state.  
 - if the error is repeated, check the set response monitoring in the bus configuration (HW Config).  
 - slave redundancy: For operation on a Y link, it must be ensured that "DP alarm mode = DPV1" is set in the slave parameterization.

---

**A01920 (F) PROFIBUS: Interruption cyclic connection**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The cyclic connection to the PROFIBUS master is interrupted.  
**Remedy:** Establish the PROFIBUS connection and activate the PROFIBUS master in the cyclic mode.  
**Note:**  
 If there is no communication to a higher-level control system, then p2030 should be set = 0 to suppress this message.  
 See also: p2030 (Field bus interface protocol selection)

---

**A01945 PROFIBUS: Connection to the Publisher failed**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For PROFIBUS peer-to-peer data transfer, the connection to at least one Publisher has failed.  
 Alarm value (r2124, interpret binary):  
 Bit 0 = 1: Publisher with address in r2077[0], connection failed.  
 ...  
 Bit 15 = 1: Publisher with address in r2077[15], connection failed.  
**Remedy:** Check the PROFIBUS cables.  
 See also: r2077 (PROFIBUS diagnostics peer-to-peer data transfer addresses)

---

**F01946 (A) PROFIBUS: Connection to the Publisher aborted**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The connection to at least one Publisher for PROFIBUS peer-to-peer data transfer in cyclic operation has been aborted.  
 Fault value (r0949, interpret binary):  
 Bit 0 = 1: Publisher with address in r2077[0], connection aborted.  
 ...  
 Bit 15 = 1: Publisher with address in r2077[15], connection aborted.  
**Remedy:**  
 - check the PROFIBUS cables.  
 - check the state of the Publisher that has the aborted connection.  
 See also: r2077 (PROFIBUS diagnostics peer-to-peer data transfer addresses)

---

**F01951 CU SYNC: Synchronization application clock cycle missing**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)  
**Reaction:** OFF2 (NONE)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** Internal synchronization of the application cycles unsuccessful.  
 Fault value (r0949, interpret decimal):  
 Only for internal Siemens troubleshooting.  
**Remedy:**  
 - carry out a POWER ON (switch-off/switch-on) for all components.  
 - upgrade the Control Unit software.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A01953</b>	<b>CU SYNC: Synchronization not completed</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	After the drive system was switched on, synchronization between the basic clock cycle and application clock cycle was started but was not completed within the selected time tolerance. Alarm value (r2124, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	Carry out a POWER ON (switch-off/switch-on).

---

<b>A02050</b>	<b>Trace: Start not possible</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The trace has already been started.
<b>Remedy:</b>	Stop the trace and, if necessary, start again.

---

<b>A02051</b>	<b>Trace: recording not possible as a result of know-how protection</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	TRACE recording is not possible as at least one signal or trigger signal being used is under know-how protection. Alarm value (r2124, interpret decimal): 1: Recorder 0 2: Recorder 1 3: Recorders 0 and 1
<b>Remedy:</b>	- Temporarily activate or deactivate know-how protection (p7766). - include the signal in the OEM exception list (p7763, p7764). - Where relevant do not record the signal. See also: p7763 (KHP OEM exception list number of indices for p7764), p7764 (KHP OEM exception list)

---

<b>A02055</b>	<b>Trace: Recording time too short</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The trace duration is too short. The minimum is twice the value of the trace clock cycle.
<b>Remedy:</b>	Check the selected recording time and, if necessary, adjust.

---

<b>A02056</b>	<b>Trace: Recording cycle too short</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The selected recording clock cycle is lower than the basic clock cycle 500µs.
<b>Remedy:</b>	Increase the value for the trace cycle.

---

<b>A02057</b>	<b>Trace: Time slice clock cycle invalid</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The time slice clock cycle selected does not match any of the existing time slices.
<b>Remedy:</b>	Enter an existing time slice clock cycle. The existing time slices can be read out via p7901.

---

<b>A02058</b>	<b>Trace: Time slice clock cycle for endless trace not valid</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The selected time slice clock cycle cannot be used for the endless trace
<b>Remedy:</b>	Enter the clock cycle of an existing time slice with a cycle time $\geq 2$ ms for up to 4 recording channels or $\geq 4$ ms from 5 recording channels per trace. The existing time slices can be read out via p7901.

---

<b>A02059</b>	<b>Trace: Time slice clock cycle for 2 x 8 recording channels not valid</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The selected time slice clock cycle cannot be used for more than 4 recording channels.
<b>Remedy:</b>	Enter the clock cycle of an existing time slice with a cycle time $\geq 4$ ms or reduce the number of recording channels to 4 per trace. The existing time slices can be read out via p7901.

---

<b>A02060</b>	<b>Trace: Signal to be traced missing</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	- a signal to be traced was not specified. - the specified signals are not valid.
<b>Remedy:</b>	- specify the signal to be traced. - check whether the relevant signal can be traced.

---

<b>A02061</b>	<b>Trace: Invalid signal</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	- the specified signal does not exist. - the specified signal can no longer be traced (recorded).
<b>Remedy:</b>	- specify the signal to be traced. - check whether the relevant signal can be traced.

---

<b>A02062</b>	<b>Trace: Invalid trigger signal</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	- a trigger signal was not specified. - the specified signal does not exist. - the specified signal is not a fixed-point signal. - the specified signal cannot be used as a trigger signal for the trace.
<b>Remedy:</b>	Specify a valid trigger signal.

---

<b>A02063</b>	<b>Trace: Invalid data type</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The specified data type to select a signal using a physical address is invalid.
<b>Remedy:</b>	Use a valid data type.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A02070</b>	<b>Trace: Parameter cannot be changed</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The trace parameter settings cannot be changed when the trace is active.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- stop the trace before parameterization.</li><li>- if required, start the trace.</li></ul>

---

<b>A02075</b>	<b>Trace: Pretrigger time too long</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The selected pretrigger time must be shorter than the trace time.
<b>Remedy:</b>	Check the pretrigger time setting and change if necessary.

---

<b>F02080</b>	<b>Trace: Parameterization deleted due to unit changeover</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The trace parameterization in the drive unit was deleted due to a unit changeover or a change in the reference parameters.
<b>Remedy:</b>	Restart trace.

---

<b>A02095</b>	<b>MTrace 0: multiple trace cannot be activated</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The following functions or settings are not permissible in conjunction with a multiple trace (trace recorder 0): <ul style="list-style-type: none"><li>- measuring function</li><li>- long-time trace</li><li>- trigger condition "immediate recording start" (IMMEDIATE)</li><li>- trigger condition "start with function generator" (FG_START)</li></ul>
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- if required, deactivate the multiple trace (p4840[0] = 0).</li><li>- deactivate function or setting that is not permissible</li></ul>

---

<b>A02096</b>	<b>MTrace 0: cannot be saved</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	It is not possible to save the measurement results of a multiple trace on the memory card (trace recorder 0). A multiple trace is not started or is canceled. Alarm value (r2124, interpret decimal): 1: Memory card cannot be accessed. <ul style="list-style-type: none"><li>- card is not inserted or is blocked by a mounted USB drive.</li></ul> 3: data save operation too slow. <ul style="list-style-type: none"><li>- a second trace has been completed before the measurement results of the first trace were able to be saved.</li><li>- writing the measurement result files to the card is blocked by the parameter save.</li></ul> 4: Data save operation canceled. <ul style="list-style-type: none"><li>- for instance, the file required for the data save operation was not able to be found.</li></ul>
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- insert or remove the memory card.</li><li>- use a larger memory card.</li><li>- configure a longer trace time or use an endless trace.</li><li>- avoid saving parameters while a multiple trace is running.</li><li>- check whether other functions are presently accessing measurement result files.</li></ul>

---

**A02097 MTrace 1: multiple trace cannot be activated**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The following functions or settings are not permissible in conjunction with a multiple trace (trace recorder 1):  
- measuring function  
- long-time trace  
- trigger condition "immediate recording start" (IMMEDIATE)  
- trigger condition "start with function generator" (FG\_START)  
**Remedy:**  
- if required, deactivate the multiple trace (p4840[1] = 0).  
- deactivate function or setting that is not permissible

---

**A02098 MTrace 1: cannot be saved**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** It is not possible to save the measurement results of a multiple trace on the memory card (trace recorder 1).  
A multiple trace is not started or is canceled.  
Alarm value (r2124, interpret decimal):  
1: Memory card cannot be accessed.  
- card is not inserted or is blocked by a mounted USB drive.  
3: data save operation to slow.  
- a second trace has been completed before the measurement results of the first trace were able to be saved.  
- writing the measurement result files to the card is blocked by the parameter save.  
4: Data save operation canceled.  
- for instance, the file required for the data save operation was not able to be found.  
**Remedy:**  
- insert or remove the memory card.  
- use a larger memory card.  
- configure a longer trace time or use an endless trace.  
- avoid saving parameters while a multiple trace is running.  
- check whether other functions are presently accessing measurement result files.

---

**A02099 Trace: Insufficient Control Unit memory**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The memory space still available on the Control Unit is no longer sufficient for the trace function.  
**Remedy:** Reduce the memory required, e.g. as follows:  
- reduce the trace time.  
- increase the trace clock cycle.  
- reduce the number of signals to be traced.

---

**A02150 OA: Application cannot be loaded**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The system was not able to load an OA application.  
Alarm value (r2124, interpret hexadecimal):  
16:  
The interface version in the DCB user library is not compatible to the DCC standard library that has been loaded.  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade firmware to later version.  
- contact Technical Support.

## 4 Faults and alarms

### 4.2 List of faults and alarms

For alarm value = 16:

Load a compatible DCB user library (compatible to the interface of the DCC standard library).

<b>F02151 (A)</b>	<b>OA: Internal software error</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2 (NONE, OFF1, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	An internal software error has occurred within an OA application. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on) for all components. - upgrade firmware to later version. - contact Technical Support. - replace the Control Unit. Note: OA: Open Architecture
<hr/>	
<b>F02152 (A)</b>	<b>OA: Insufficient memory</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	Too many functions have been configured on this Control Unit (e.g. too many drives, function modules, data sets, OA applications, blocks, etc.). Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- change the configuration on this Control Unit (e.g. fewer drives, function modules, data sets, OA applications, blocks, etc.). - use an additional Control Unit. Note: OA: Open Architecture
<hr/>	
<b>F03000</b>	<b>NVRAM fault on action</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A fault occurred during execution of action p7770 = 1 or 2 for the NVRAM data. Fault value (r0949, interpret hexadecimal): yyxx hex: yy = fault cause, xx = application ID yy = 1: The action p7770 = 1 is not supported by this version if Drive Control Chart (DCC) is activated for the drive object concerned. yy = 2: The data length of the specified application is not the same in the NVRAM and the backup. yy = 3: The data checksum in p7774 is not correct. yy = 4: No data available to load.
<b>Remedy:</b>	- Perform the remedy according to the results of the troubleshooting. - if necessary, start the action again.

---

**F03001 NVRAM checksum incorrect**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A checksum error occurred when evaluating the non-volatile data (NVRAM) on the Control Unit.  
The NVRAM data affected was deleted.  
**Remedy:** Carry out a POWER ON (switch-off/switch-on) for all components.

---

**F03505 (N, A) Analog input wire breakage**

**Message class:** External measured value / signal state outside the permissible range (16)  
**Reaction:** OFF1 (NONE, OFF2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The wire-break monitoring for an analog input has responded.  
The input value of the analog input has undershot the threshold value parameterized in p0761[0...3].  
p0756[0]: analog input 0 (only CU240D-2)  
p0756[1]: analog input 1 (only CU240D-2)  
Fault value (r0949, interpret decimal):  
yxxx dec  
y = analog input (0 = analog input 0 (AI 0), 1 = analog input 1 (AI 1))  
xxx = component number (p0151)  
**Note:**  
For the following analog input type, the wire breakage monitoring is active:  
p0756[0...1] = 1 (2 ... 10 V with monitoring)  
**Remedy:**  
- Check the connection to the signal source for interruptions.  
- check the magnitude of the injected current - it is possible that the infed signal is too low.  
**Note:**  
The input current measured by the analog input can be read in r0752[x].

---

**A03510 (F, N) Calibration data not plausible**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** During booting, the calibration data for the analog inputs is read and checked with respect to plausibility.  
At least one calibration data point was determined to be invalid.  
**Remedy:**  
- switch-off/switch-on the power supply for the Control Unit.  
**Note:**  
If it reoccurs, then replace the module.  
In principle, operation could continue.  
The analog channel involved possibly does not achieve the specified accuracy.

---

**A05000 (N) Power unit: Overtemperature heat sink AC inverter**

**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The alarm threshold for overtemperature at the inverter heat sink has been reached. The response is set using p0290.  
If the heat sink temperature exceeds the value set in p0292[0], then fault F30004 is output.  
**Remedy:** Check the following:  
- is the ambient temperature within the defined limit values?  
- have the load conditions and the load duty cycle been appropriately dimensioned?  
- has the cooling failed?

---

<b>A05001 (N)</b>	<b>Power unit: Overtemperature depletion layer chip</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	Alarm threshold for overtemperature of the power semiconductor in the AC converter has been reached. Note: - the response is set using p0290. - if the temperature of the barrier layer increases by the value set in p0292[1], then fault F30025 is initiated.
<b>Remedy:</b>	Check the following: - is the ambient temperature within the defined limit values? - have the load conditions and the load duty cycle been appropriately dimensioned? - has the cooling failed? - pulse frequency too high? See also: r0037 (Power unit temperatures), p0290 (Power unit overload response)

---

<b>A05002 (N)</b>	<b>Power unit: Air intake overtemperature</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For chassis power units, the following applies: The alarm threshold for the air intake overtemperature has been reached. For air-cooled power units, the threshold is 42 °C (hysteresis 2 K). The response is set using p0290. If the air intake temperature increases by an additional 13 K, then fault F30035 is output.
<b>Remedy:</b>	Check the following: - is the ambient temperature within the defined limit values? - has the fan failed? Check the direction of rotation.

---

<b>A05004 (N)</b>	<b>Power unit: Rectifier overtemperature</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The alarm threshold for the overtemperature of the rectifier has been reached. The response is set using p0290. If the temperature of the rectifier increases by an additional 5 K, then fault F30037 is triggered.
<b>Remedy:</b>	Check the following: - is the ambient temperature within the defined limit values? - have the load conditions and the load duty cycle been appropriately dimensioned? - has the fan failed? Check the direction of rotation. - has a phase of the line supply failed? - is an arm of the supply (incoming) rectifier defective?

---

<b>A05006 (N)</b>	<b>Power unit: Overtemperature thermal model</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The temperature difference between the chip and heat sink has exceeded the permissible limit value (blocksize power units only). Depending on p0290, an appropriate overload response is initiated. See also: r0037 (Power unit temperatures)
<b>Remedy:</b>	Not necessary. The alarm disappears automatically once the limit value is undershot. Note: If the alarm does not disappear automatically and the temperature continues to rise, this can result in fault F30024. See also: p0290 (Power unit overload response)

<b>A05065 (F, N)</b>	<b>Voltage measured values not plausible</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The voltage measurement does not supply any plausible values and is not used. Alarm value (r2124, interpret bitwise binary): Bit 1: Phase U Bit 2: Phase V Bit 3: Phase W
<b>Remedy:</b>	The following parameterization must be made in order to deactivate the alarm: - Deactivate voltage measurement (p0247.0 = 0). - Deactivate flying restart with voltage measurement (p0247.5 = 0) and deactivate fast flying restart (p1780.11 = 0).
<hr/>	
<b>F06310 (A)</b>	<b>Supply voltage (p0210) incorrectly parameterized</b>
<b>Message class:</b>	Network fault (2)
<b>Reaction:</b>	NONE (OFF1, OFF2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The measured DC voltage lies outside the tolerance range after precharging has been completed. Permissible range: $1.16 * p0210 < r0070 < 1.6 * p0210$ Note: The fault can only be acknowledged when the drive is switched off. See also: p0210 (Drive unit line supply voltage)
<b>Remedy:</b>	- check the parameterized supply voltage and if required change (p0210). - check the line supply voltage. See also: p0210 (Drive unit line supply voltage)
<hr/>	
<b>A06921 (N)</b>	<b>Braking resistor phase asymmetry</b>
<b>Message class:</b>	Braking Module faulted (14)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	- the three resistors of the braking chopper are not symmetrical. - DC link voltage oscillations caused by fluctuating loads of the connected drives.
<b>Remedy:</b>	- check the feeder cables to the braking resistors. - if required, increase the value for detecting asymmetry (p1364).
<hr/>	
<b>F06922</b>	<b>Braking resistor phase failure</b>
<b>Message class:</b>	Braking Module faulted (14)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A phase failure for the brake resistor was detected. Fault value (r0949, interpret decimal): 11: Phase U 12: Phase V 13: Phase W
<b>Remedy:</b>	Check the feeder cables to the braking resistors.
<hr/>	
<b>F07011</b>	<b>Drive: Motor overtemperature</b>
<b>Message class:</b>	Motor overload (8)
<b>Reaction:</b>	OFF2 (NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	KTY84/PT1000: The motor temperature has exceeded the fault threshold (p0605) or the timer (p0606) after the alarm threshold was exceeded (p0604) has expired. The response parameterized in p0610 becomes active. The alarm is withdrawn if the response threshold for wire breakage or sensor not connected is exceeded ( $R > 2120 \text{ Ohm}$ ).

## 4 Faults and alarms

### 4.2 List of faults and alarms

PTC or bimetallic NC contact:

The response threshold of 1650 Ohm was exceeded or the NC contact opened and the timer (p0606) has expired. The response parameterized in p0610 becomes active.

Possible causes:

- motor is overloaded.
- motor ambient temperature too high.
- wire breakage or sensor not connected.

Fault value (r0949, interpret decimal):

200:

Motor temperature model 1 (I2t): temperature too high.

See also: p0604, p0605, p0606, p0612, p0613, p0625, p0626, p0627, p0628

**Remedy:**

- reduce the motor load.
  - check the ambient temperature and the motor ventilation.
  - check the wiring and the connection of the PTC or bimetallic NC contact.

#### **A07014 (N)**

#### **Drive: Motor temperature model configuration alarm**

**Message class:**

Motor overload (8)

**Reaction:**

NONE

**Acknowledge:**

NONE

**Cause:**

A fault has occurred in the configuration of the motor temperature model.

Alarm value (r2124, interpret decimal):

1:

All motor temperature models: It is not possible to save the model temperature

See also: p0610 (Motor overtemperature response)

**Remedy:**

- set the response for motor overtemperature to "Alarm and fault, no reduction of I\_max" (p0610 = 2).
- See also: p0610 (Motor overtemperature response)

<b>F07082</b>	<b>Macro: Execution not possible</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The macro cannot be executed. Fault value (r0949, interpret hexadecimal): ccccbbaa hex: cccc = preliminary parameter number, bb = supplementary information, aa = fault cause Fault causes for the trigger parameter itself: 19: Called file is not valid for the trigger parameter. 20: Called file is not valid for parameter 15. 21: Called file is not valid for parameter 700.

## 4 Faults and alarms

### 4.2 List of faults and alarms

- 22: Called file is not valid for parameter 1000.
- 23: Called file is not valid for parameter 1500.
- 24: Data type of a TAG is incorrect (e.g. Index, number or bit is not U16).
- Fault causes for the parameters to be set:
- 25: Error level has an undefined value.
- 26: Mode has an undefined value.
- 27: A value was entered as string in the tag value that is not "DEFAULT".
- 31: Entered drive object type unknown.
- 32: A device was not able to be found for the determined drive object number.
- 34: A trigger parameter was recursively called.
- 35: It is not permissible to write to the parameter via macro.
- 36: Check, writing to a parameter unsuccessful, parameter can only be read, not available, incorrect data type, value range or assignment incorrect.
- 37: Source parameter for a BICO interconnection was not able to be determined.
- 38: An index was set for a non-indexed (or CDS-dependent) parameter.
- 39: No index was set for an indexed parameter.
- 41: A bit operation is only permissible for parameters with the parameter format DISPLAY\_BIN.
- 42: A value not equal to 0 or 1 was set for a BitOperation.
- 43: Reading the parameter to be changed by the BitOperation was unsuccessful.
- 51: Factory setting for DEVICE may only be executed on the DEVICE.
- 61: The setting of a value was unsuccessful.

**Remedy:**

- check the parameter involved.
  - check the macro file and BICO interconnection.
- See also: p0015 (Macro drive unit), p1000 (Speed setpoint selection)

---

**F07083****Macro: ACX file not found****Message class:**

Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:**

NONE

**Acknowledge:**

IMMEDIATELY

**Cause:**

The ACX file (macro) to be executed was not able to be found in the appropriate directory.  
Fault value (r0949, interpret decimal):  
Parameter number with which the execution was started.  
See also: p0015 (Macro drive unit), p1000 (Speed setpoint selection)

**Remedy:**

- check whether the file is saved in the appropriate directory on the memory card.

---

**F07084****Macro: Condition for WaitUntil not fulfilled****Message class:**

Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:**

NONE

**Acknowledge:**

IMMEDIATELY

**Cause:**

The WaitUntil condition set in the macro was not fulfilled in a certain number of attempts.  
Fault value (r0949, interpret decimal):  
Parameter number for which the condition was set.

**Remedy:**

- Check and correct the conditions for the WaitUntil loop.

---

**F07086****Units changeover: Parameter limit violation due to reference value change****Message class:**

Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:**

NONE

**Acknowledge:**

IMMEDIATELY

**Cause:**

A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit notation.  
The values of the parameters were set to the corresponding violated minimum limit/maximum limit or to the factory setting.  
Possible causes:  
- the steady-state minimum limit/maximum limit or that defined in the application was violated.

Fault value (r0949, parameter):  
Diagnostics parameter to display the parameters that were not able to be re-calculated.  
See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004  
**Remedy:** Check the adapted parameter value and if required correct.

---

**F07088**      **Units changeover: Parameter limit violation due to units changeover**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A changeover of units was initiated. This resulted in a violation of a parameter limit  
Possible causes for the violation of a parameter limit:  
- When rounding off a parameter corresponding to its decimal places, the steady-state minimum limit or maximum limit was violated.  
- inaccuracies for the data type "FloatingPoint".  
In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down.  
Fault value (r0949, interpret decimal):  
Diagnostics parameter to display all parameters whose value had to be adapted.  
See also: p0100 (IEC/NEMA mot stds), p0505 (Selecting the system of units), p0595 (Technological unit selection)  
**Remedy:** Check the adapted parameter values and if required correct.

---

**A07089**      **Changing over units: Function module activation is blocked because the units have been changed over**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An attempt was made to activate a function module. This is not permissible if the units have already been changed over.  
See also: p0100 (IEC/NEMA mot stds), p0505 (Selecting the system of units)  
**Remedy:** Restore units that have been changed over to the factory setting.

---

**A07092**      **Drive: moment of inertia estimator still not ready**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The moment of inertia estimator still has no valid values.  
The acceleration cannot be calculated.  
The moment of inertia estimator is ready, if the frictional values (p1563, p1564) as well as the moment of inertia value (p1493) have been determined (r1407.26 = 1).  
**Remedy:** Repeat the operation when the moment of inertia estimator is ready (r1407.26 = 1).

---

**A07094**      **General parameter limit violation**  
**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** As a result of the violation of a parameter limit, the parameter value was automatically corrected.  
Minimum limit violated --> parameter is set to the minimum value.  
Maximum limit violated --> parameter is set to the maximum value.  
Alarm value (r2124, interpret decimal):  
Parameter number, whose value had to be adapted.  
**Remedy:** Check the adapted parameter values and if required correct.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A07200</b>	<b>Drive: Master control ON command present</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The ON/OFF1 command is present (no 0 signal). The command is either influenced via binector input p0840 (current CDS) or control word bit 0 via the master control.
<b>Remedy:</b>	Switch the signal via binector input p0840 (current CDS) or control word bit 0 via the master control to 0.

---

<b>F07220 (N, A)</b>	<b>Drive: Master control by PLC missing</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The "master control by PLC" signal was missing in operation. - interconnection of the binector input for "master control by PLC" is incorrect (p0854). - the higher-level control has withdrawn the "master control by PLC" signal. - data transfer via the fieldbus (master/drive) was interrupted.
<b>Remedy:</b>	- check the interconnection of the binector input for "master control by PLC" (p0854). - check the "master control by PLC" signal and, if required, switch in. - check the data transfer via the fieldbus (master/drive). Note: If the drive should continue to operate after withdrawing "master control by PLC" then fault response must be parameterized to NONE or the message type should be parameterized as alarm.

---

<b>F07320</b>	<b>Drive: Automatic restart interrupted</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	- the specified number of restart attempts (p1211) has been completely used up because within the monitoring time (p1213) the faults were not able to be acknowledged. The number of restart attempts (p1211) is decremented at each new start attempt. - the monitoring time for the power unit has expired. - when exiting commissioning or at the end of the motor identification routine or the speed controller optimization, the drive unit is not automatically powered up again. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- increase the number of restart attempts (p1211). - increase the delay time in p1212 and/or the monitoring time in p1213. - reduce the delay time to reset the start counter p1213[1] so that fewer faults are registered in the time interval.

---

<b>A07321</b>	<b>Drive: Automatic restart active</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The automatic restart (AR) is active. When the line supply returns and/or the causes of the existing faults are removed the drive is automatically restarted. The pulses are enabled and the motor starts to rotate. For p1210 = 26, restarting is realized with the delayed setting of the ON command.
<b>Remedy:</b>	- the automatic restart (AR) should, if required, be inhibited (p1210 = 0). - an automatic restart can be directly interrupted by withdrawing the switch-on command (BI: p0840). - for p1210 = 26: by withdrawing the OFF2- / OFF3 command.

---

<b>F07330</b>	<b>Flying restart: Measured search current too low</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (NONE, OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	During a flying restart, it was identified that the search current reached is too low. It is possible that the motor is not connected.

**Remedy:** Check the motor feeder cables.

---

**F07331 Flying restart: Function not supported**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2 (NONE, OFF1)

**Acknowledge:** IMMEDIATELY

**Cause:** It is not possible to power up with the motor rotating (no flying restart).  
In the following cases, the "flying restart" function is not supported:  
PMSM: operation with U/f characteristic and sensorless vector control.

Note:

PMSM: permanent-magnet synchronous motor

**Remedy:** Deactivate the "flying restart" function (p1200 = 0).

---

**F07332 Flying restart: maximum speed reduced**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2 (NONE, OFF1)

**Acknowledge:** IMMEDIATELY

**Cause:** The maximum speed that can be reached is reduced; at very high speeds problems associated with the flying restart can be encountered.

Possible causes:

- power ratio, power unit/motor too high

**Remedy:** Parameter changes are not required.

Note:

A flying restart at speeds above 3000 rpm should be avoided.

---

**A07352 Drive: Limit switch signals not plausible**

**Message class:** Application/technological function faulted (17)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Limit switch signals are not plausible.

Possible causes:

- BICO interconnections are not OK (p3342, p3343).

- sensors are not supplying a valid signal (both supply a 0 signal).

**Remedy:** - check the BICO interconnections for the limit switch signals.

- check the sensors.

See also: p3342 (Limit switch plus), p3343 (Limit switch minus)

---

**A07400 (N) Drive: DC link voltage maximum controller active**

**Message class:** Application/technological function faulted (17)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282).

The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds.

When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value.

See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller configuration (vector control)), p1280 (Vdc controller configuration (U/f))

**Remedy:** If the controller is not to intervene:

- increase the ramp-down times.

- switch off the Vdc\_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control).

If the ramp-down times are not to be changed:

- use a chopper or regenerative feedback unit.

<b>A07401 (N)</b>	<b>Drive: DC link voltage maximum controller deactivated</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The Vdc_max controller can no longer maintain the DC link voltage (r0070) below the limit value (r1242, r1282) and was therefore switched out (disabled). - the line supply voltage is permanently higher than specified for the power unit. - the motor is permanently in the regenerative mode as a result of a load that is driving the motor.
<b>Remedy:</b>	- check whether the input voltage is within the permissible range (if required, increase the value in p0210). - check whether the load duty cycle and load limits are within the permissible limits.
<b>A07402 (N)</b>	<b>Drive: DC link voltage minimum controller active</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The DC link voltage controller has been activated as the lower switch-in threshold has been undershot (r1246, r1286). The kinetic energy of the motor is used to buffer the DC link. The drive is therefore braked. See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller configuration (vector control)), p1280 (Vdc controller configuration (U/f))
<b>Remedy:</b>	The alarm disappears when power supply returns.
<b>F07404</b>	<b>Drive: DC link voltage monitoring Vdc_max</b>
<b>Message class:</b>	DC link overvoltage (4)
<b>Reaction:</b>	OFF2 (NONE, OFF1, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The monitoring of the DC link voltage p1284 has responded (only U/f control).
<b>Remedy:</b>	- check the line supply voltage. - check the braking module. - adapt the device supply voltage (p0210). - adapt the DC link voltage monitoring (p1284).
<b>F07405 (N, A)</b>	<b>Drive: Kinetic buffering minimum speed fallen below</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	During kinetic buffering the speed fell below minimum speed (p1257 or p1297 for vector drives with U/f control) and the line supply did not return.

<b>F07754</b>	<b>Drive: Incorrect shutoff valve configuration</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	An incorrect shutoff valve configuration was detected. Fault value (r0949, interpret decimal): 100: Enable Safety Integrated (p9601/p9801), but p0218.0 = 0 (shutoff valve not available).

101:

The manipulated variable inhibit time is set less than the wait time to evaluate the feedback signal contacts when switching on the shutoff valve (p0230 < p9625[0]/p9825[0]).

102:

The manipulated variable inhibit time is set less than the wait time to evaluate the feedback signal contacts when switching off the shutoff valve (p0230 < p9625[1]/p9825[1]).

**Remedy:**

For fault value = 100:

Check the enable of Safety Integrated and the shutoff valve (p9601/p9801, p0218.0).

For fault value = 101:

Set the manipulated variable inhibit time higher than the wait time to evaluate the feedback signal contacts when switching on the shutoff valve (p0230 > p9625[0]/p9825[0]).

For fault value = 102:

Set the manipulated variable inhibit time higher than the wait time to evaluate the feedback signal contacts when switching off the shutoff valve (p0230 > p9625[1]/p9825[1]).

**F07800 Drive: No power unit present**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit parameters cannot be read or no parameters are stored in the power unit.

Note:

This fault also occurs if an incorrect topology was selected in the commissioning software and this parameterization is then downloaded to the Control Unit.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- check the power unit and replace if necessary.
- check the Control Unit, and if required replace it.
- after correcting the topology, the parameters must be again downloaded using the commissioning software.

**F07801 Drive: Motor overcurrent**

**Message class:** Motor overload (8)

**Reaction:** OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The permissible motor limit current was exceeded.

- effective current limit set too low.
- current controller not correctly set.
- U/f operation: Up ramp was set too short or the load is too high.
- U/f operation: Short-circuit in the motor cable or ground fault.
- U/f operation: Motor current does not match current of power unit.
- Switch to rotating motor without flying restart function (p1200).

Note:

Limit current = 2 x minimum (p0640, 4 x p0305 x p0306) >= 2 x p0305 x p0306

**Remedy:**

- check the current limits (p0640).
- U/f control: Check the current limiting controller (p1340 ... p1346).
- increase the up ramp (p1120) or reduce the load.
- check the motor and motor cables for short-circuit and ground fault.
- check the motor for the star-delta configuration and rating plate parameterization.
- check the power unit and motor combination.
- Choose "flying restart" function (p1200) if switched to rotating motor.

**F07802 Drive: Infeed or power unit not ready**

**Message class:** Infeed faulted (13)

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** After an internal switch-on command, the infeed or drive does not signal ready.

- monitoring time is too short.
- DC link voltage is not present.
- associated infeed or drive of the signaling component is defective.
- supply voltage incorrectly set.

**Remedy:**

- ensure that there is a DC link voltage. Check the DC link busbar. Enable the infeed.
- replace the associated infeed or drive of the signaling component.
- check the line supply voltage setting (p0210).

See also: p0857 (Power unit monitoring time)

**A07805 (N) Drive: Power unit overload I2t**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Alarm threshold for I2t overload of the power unit exceeded.

The response parameterized in p0290 becomes active.

See also: p0290 (Power unit overload response)

**Remedy:**

- reduce the continuous load.
- adapt the load duty cycle.
- check the assignment of the motor and power unit rated currents.

---

**F07807 Drive: Short-circuit/ground fault detected**

**Message class:** Ground fault / inter-phase short-circuit detected (7)

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** A phase-phase short-circuit or ground fault was detected at the motor-side output terminals of the converter.

Fault value (r0949, interpret decimal):

1: Short-circuit, phase UV.

2: Short-circuit, phase UW.

3: Short-circuit, phase VW.

4: Ground fault with overcurrent.

1yxxx: Ground fault with current in phase U detected (y = pulse number, xxxx = component of the current in phase V in per mille).

2yxxx: Ground fault with current in phase V detected (y = pulse number, xxxx = component of the current in phase U in per mille).

Note:

Also when interchanging the line and motor cables is identified as a motor-side short circuit.

The ground fault test only functions when the motor is stationary.

Connecting to a motor that is either not de-energized or partially de-energized is possibly detected as ground fault.

**Remedy:**

- check the motor-side converter connection for a phase-phase short-circuit.
- rule-out interchanged line and motor cables.
- check for a ground fault.

For a ground fault the following applies:

- do not enable the pulses when connecting to a rotating motor without the "Flying restart" function activated (p1200).
- increase the de-energization time (p0347).
- increase pulse suppression delay time (p1228) to ensure standstill.
- if required, deactivate the monitoring (p1901).

---

<b>A07891</b>	<b>Drive: Load monitoring pump/fan blocked</b>
<b>Message class:</b>	Motor overload (8)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The load monitoring is configured for a pump or fan (p2193 = 4, 5). The monitoring function detects when the pump/fan is blocked. It is possible that the blocking torque threshold (p2168) is set too low (e.g. heavy duty starting). See also: p2165 (Load monitoring stall monitoring upper threshold), p2168 (Load monitoring stall monitoring torque threshold)
<b>Remedy:</b>	- check whether the pump/fan is blocked, and if blocked, then resolve the problem. - check that the fan can freely move, and if necessary, resolve the problem. - adapt the parameterization corresponding to the load (p2165, p2168)..

---

<b>A07892</b>	<b>Drive: Load monitoring pump/fan no load condition</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The load monitoring is configured for a pump or fan (p2193 = 4, 5). The monitoring function detects when the pump/fan is operating under no load conditions. The pump is running in the dry state (no medium to be pumped) – or the fan has a broken belt. It is possible that the detection torque threshold is too low (p2191). See also: p2191 (Load monitoring torque threshold no load)
<b>Remedy:</b>	- for a pump, check the medium being pumped, and if required, provide the medium. - for a fan, check the belt, and if required, replace. - if necessary, increase the detection torque threshold (p2191).

---

<b>A07893</b>	<b>Drive: Load monitoring pump leakage</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The load monitoring is configured for a pump (p2193 = 4). The monitoring function detects a leak in the pump circuit. In this case, the pump requires a torque that is lower than in normal operation to pump the reduced quantity.
<b>Remedy:</b>	- remove the leak in the pump circuit. - for a nuisance trip, reduce the torque thresholds of the leakage characteristic (p2186, p2188, p2190).

---

<b>F07894</b>	<b>Drive: Load monitoring pump/fan blocked</b>
<b>Message class:</b>	Motor overload (8)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The load monitoring is configured for a pump or fan (p2193 = 4, 5). The monitoring function detects when the pump/fan is blocked. It is possible that the blocking torque threshold (p2168) is set too low (e.g. heavy duty starting). See also: p2165 (Load monitoring stall monitoring upper threshold), p2168 (Load monitoring stall monitoring torque threshold)
<b>Remedy:</b>	- check whether the pump/fan is blocked, and if blocked, then resolve the problem. - check that the fan can freely move, and if necessary, resolve the problem. - adapt the parameterization corresponding to the load (p2165, p2168)..

---

<b>F07895</b>	<b>Drive: Load monitoring pump/fan no load condition</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The load monitoring is configured for a pump or fan (p2193 = 4, 5). The monitoring function detects when the pump/fan is operating under no load conditions. The pump is running in the dry state (no medium to be pumped) – or the fan has a broken belt. It is possible that the detection torque threshold is too low (p2191). See also: p2191 (Load monitoring torque threshold no load)
<b>Remedy:</b>	- for a pump, check the medium being pumped, and if required, provide the medium. - for a fan, check the belt, and if required, replace. - if necessary, increase the detection torque threshold (p2191).

---

<b>F07896</b>	<b>Drive: Load monitoring pump leakage</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The load monitoring is configured for a pump (p2193 = 4). The monitoring function detects a leak in the pump circuit. In this case, the pump requires a torque that is lower than in normal operation to pump the reduced quantity.
<b>Remedy:</b>	- remove the leak in the pump circuit. - for a nuisance trip, reduce the torque thresholds of the leakage characteristic (p2186, p2188, p2190).

---

<b>F07900 (N, A)</b>	<b>Drive: Motor blocked</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Motor has been operating at the torque limit at a low speed for a longer period of time and below the set speed threshold. This signal can also be triggered if the speed is oscillating and the speed controller output repeatedly goes to its limit. It may also be the case that thermal monitoring of the power unit reduces the current limit (see p0290), thereby causing the motor to decelerate.

- Remedy:**
- check that the motor can freely move.
  - check the effective torque limit (r1538, r1539).
  - check the direction of rotation enable signals for a flying restart of the motor (p1110, p1111).
  - for U/f control: check the current limits and acceleration times (p0640, p1120).

---

**F07901 Drive: Motor overspeed**

**Message class:** Application/technological function faulted (17)

**Reaction:** OFF2 (IASC/DCBRK)

**Acknowledge:** IMMEDIATELY

**Cause:** The maximum permissible speed was either positively or negatively exceeded.  
 The maximum permissible positive speed is formed as follows: Minimum (p1082)  
 The maximum permissible negative speed is formed as follows: Maximum (-p1082)

**Remedy:** The following applies for a positive direction of rotation:  
 - check r1084 and if required, correct p1082.  
 The following applies for a negative direction of rotation:  
 - check r1087 and if required, correct p1082.  
 Activate pre-control of the speed limiting controller (bit 7 = 1).  
 Increase the hysteresis for the overspeed signal. This upper limit is dependent upon the maximum motor speed p0322 and the maximum speed p1082 of the setpoint channel.

---

**F07902 (N, A) Drive: Motor stalled**

**Message class:** Application/technological function faulted (17)

**Reaction:** OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** The system has identified that the motor has stalled for a time longer than is set.  
 Fault value (r0949, interpret decimal):

1: Reserved.

2: Stall detection using r1408.12 (p1745) or via (r0084 ... r0083).

**Remedy:** Steps should always be taken to ensure that both motor data identification and the rotating measurement were carried out (see p1900, r3925).  
 - check whether the drive stalls solely due to the load in controlled mode or when the speed setpoint is still zero. If yes, then increase the current setpoint using p1610.  
 - if the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again.  
 - check whether the motor cables are disconnected (see A07929).  
 If there is no fault, then the fault tolerance can be increased (p1745).  
 - check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized.  
 - If the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1553.

---

**A07910 (N) Drive: Motor overtemperature**

**Message class:** Motor overload (8)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** KTY84/PT1000 or no sensor:

The measured motor temperature or the temperature of the motor temperature model 2 has exceeded the alarm threshold (p0604). The response parameterized in p0610 becomes active.

PTC or bimetallic NC contact:

The response threshold of 1650 Ohm was exceeded or the NC contact opened.

Alarm value (r2124, interpret decimal):

11: No output current reduction.

12: Output current reduction active.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:**

- check the motor load.
- check the motor ambient temperature.
- check KTY84/PT1000.
- check overtemperatures of the motor temperature model 2 (p0626 ... p0628).

See also: p0612 (Mot\_temp\_mod activation), p0625 (Motor ambient temperature during commissioning), p0626 (Motor overtemperature, stator core), p0627 (Motor overtemperature, stator winding), p0628 (Motor overtemperature rotor)

#### **A07927 DC braking active**

**Message class:** Application/technological function faulted (17)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The motor is braked with DC current. DC braking is active.

1)

A message with response DCBRK is active. The motor is braked with the braking current set in p1232 for the duration set in in p1233. If the standstill threshold is fallen below, then braking is prematurely canceled.

2)

DC braking has been activated at binector input p1230 with the DC braking set (p1230 = 4). Braking current p1232 is injected until this binector input becomes inactive.

**Remedy:** Not necessary.

The alarm automatically disappears once DC braking has been executed.

---

#### **A07929 (F) Drive: No motor detected**

**Message class:** Application/technological function faulted (17)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The absolute current value is so small after enabling the inverter pulses that no motor is detected.

Note:

- in the case of vector control and an induction motor, this alarm is followed by fault F07902.

**Remedy:**

- check the motor feeder cables.
- check the voltage boost of the U/f control (p1310).
- carry out a standstill measurement to set the stator resistance (p0350).

---

#### **F07950 (A) Motor parameter incorrect**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The motor parameters were incorrectly entered while commissioning (e.g. p0300 = 0, no motor)

Fault value (r0949, interpret decimal):

Parameter number involved.

See also: p0300, p0301, p0304, p0305, p0307, p0310, p0311, p0314, p0316, p0320, p0322, p0323

**Remedy:** Compare the motor data with the rating plate data and if required, correct.

---

#### **A07960 Drive: Incorrect friction characteristic**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The friction characteristic is incorrect.

Alarm value (r2124, interpret decimal):

1538:

The friction torque is greater than the maximum from the upper effective torque limit (p1538) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value.

1539:

The friction torque is less than the minimum from the lower effective torque limit (p1539) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value.

3820 ... 3829:

Incorrect parameter number. The speeds entered in the parameters for the friction characteristic do not correspond to the following condition:

$0.0 < p3820 < p3821 < \dots < p3829 \leq p0322$  or  $p1082$ , if  $p0322 = 0$

Therefore the output of the friction characteristic (r3841) is set to zero.

3830 ... 3839:

Incorrect parameter number. The torques entered in the parameters for the friction characteristic do not correspond to the following condition:

$0 \leq p3830, p3831 \dots p3839 \leq p0333$

Therefore the output of the friction characteristic (r3841) is set to zero.

See also: r3840 (Friction characteristic status word)

**Remedy:**

Fulfill the conditions for the friction characteristic.

For alarm value = 1538:

Check the upper effective torque limit (e.g. in the field weakening range).

For alarm value = 1539:

Check the lower effective torque limit (e.g. in the field weakening range).

For alarm value = 3820 ... 3839:

Fulfill the conditions to set the parameters of the friction characteristic.

If the motor data (e.g. the maximum speed p0322) are changed during commissioning ( $p0010 = 1, 3$ ), then the technological limits and threshold values, dependent on this, must be re-calculated by selecting  $p0340 = 5$ .

---

**A07961 Drive: Friction characteristic record activated**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The automatic friction characteristic record is activated.

The friction characteristic is recorded at the next switch-on command.

When plotting the friction characteristic, it is not possible to save the parameters (p0971, p0977).

**Remedy:**

Not necessary.

The alarm disappears automatically after the friction characteristic record has been successfully completed or the record is deactivated ( $p3845 = 0$ ).

---

**F07963 Drive: Friction characteristic record interrupted**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF1

**Acknowledge:** IMMEDIATELY

**Cause:** The conditions to record the friction characteristic are not fulfilled.

Fault value (r0949, interpret decimal):

0046: Missing enable signals (r0046).

1082: The highest speed value to be approached (p3829) is greater than the maximum speed (p1082).

1084: The highest speed value to be approached (p3829) is greater than the maximum speed (r1084, p1083, p1085).

1087: The highest speed value to be approached (p3829) is greater than the maximum speed (r1087, p1086, p1088).

1110: Friction characteristic record, negative direction selected (p3845) and negative direction inhibited (p1110).

1111: Friction characteristic record, positive direction selected (p3845) and positive direction inhibited (p1111).

1198: Friction characteristic record selected (p3845 > 0) and negative (p1110) and positive directions (p1111) inhibited (r1198).

1300: The control mode (p1300) has not been set to closed-loop speed control.

1755: For encoderless closed-loop control ( $p1300 = 20$ ), the lowest speed value to be approached (p3820) is less than or equal to the changeover speed, open-loop controlled operation (p1755).

1910: Motor data identification activated.

1960: Speed controller optimization activated.

3820 ... 3829: speed (p382x) cannot be approached.

3840: Friction characteristic incorrect.

3845: Friction characteristic record de-selected.

<b>Remedy:</b>	Fulfill the conditions to record the friction characteristic. For fault value = 0046: - establish missing enable signals. For fault value = 1082, 1084, 1087: - Select the highest speed value to be approached (p3829) less than or equal to the maximum speed (p1082, r1084, r1087). - Re-calculate the speed points along the friction characteristic (p0340 = 5). For fault value = 1110: - Select the friction characteristic record, positive direction (p3845). For fault value = 1111: - Select the friction characteristic record, negative direction (p3845). For fault value = 1198: - Enable the permitted direction (p1110, p1111, r1198). For fault value = 1300: - set the control mode (p1300) on the closed-loop speed control (p1300 = 20, 21). For fault value = 1755: - For encoderless closed-loop speed control (p1300 = 20) select the lowest speed value to be approached (p3820) greater than the changeover speed of open-loop controlled operation (p1755). - Re-calculate the speed points along the friction characteristic (p0340 = 5). For fault value = 1910: - Exit the motor data identification routine (p1910). For fault value = 1960: - Exit the speed controller optimization routine (p1960). For fault value 3820 ... 3829: - check the load at speed p382x. - check the speed signal (r0063) for oscillation at speed p382x. Check the settings of the speed controller if applicable. For fault value = 3840: - Make the friction characteristic error-free (p3820 ... p3829, p3830 ... p3839, p3840). For fault value = 3845: - Activate the friction characteristic record (p3845).

**F07969****Drive: Incorrect pole position identification**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred during the pole position identification routine.

Fault value (r0949, interpret decimal):

1: Current controller limited

2: Motor shaft locked.

10: Stage 1: The ratio between the measured current and zero current is too low.

11: Stage 2: The ratio between the measured current and zero current is too low.

12: Stage 1: The maximum current was exceeded.

13: Stage 2: The maximum current was exceeded.

14: Current difference to determine the +d axis too low.

15: Second harmonic too low.

16: Drive converter too small for the measuring technique.

17: Abort due to pulse inhibit.

18: First harmonic too low.

20: Pole position identification requested with the motor shaft rotating and activated "flying restart" function.

**Remedy:**

For fault value = 1:

Check whether the motor is correctly connected.

Check whether motor data have been correctly entered.

Replace the power unit involved.

For fault value = 2:

Bring the motor into a no-load condition.

For fault value = 10:

When selecting p1980 = 4: Increase the value for p0325.

When selecting p1980 = 1: Increase the value for p0329.

Check whether the motor is correctly connected.

Replace the power unit involved.

#### F07983

#### Drive: Rotating measurement saturation characteristic

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF1 (NONE, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred while determining the saturation characteristic.

Fault value (r0949, interpret decimal):

1: The speed did not reach a steady-state condition.

2: The rotor flux did not reach a steady-state condition.

3: The adaptation circuit did not reach a steady-state condition.

4: The adaptation circuit was not enabled.

5: Field weakening active.

6: The speed setpoint was not able to be approached as the minimum limiting is active.

7: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.

8: The speed setpoint was not able to be approached as the maximum limiting is active.

9: Several values of the determined saturation characteristic are not plausible.

10: Saturation characteristic could not be sensibly determined because load torque too high.

**Remedy:**

For fault value = 1:

- the total drive moment of inertia is far higher than that of the motor (p0341, p0342).

De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.

For fault value = 1 ... 2:

- increase the measuring speed (p1961) and repeat the measurement.

For fault value = 1 ... 4:

- check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.
- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.
- carry out a motor data identification routine (p1910).
- if required, reduce the dynamic factor (p1967 < 25 %).

For fault value = 5:

- the speed setpoint (p1961) is too high. Reduce the speed.

For fault value = 6:

- adapt the speed setpoint (p1961) or minimum limiting (p1080).

For fault value = 7:

- adapt the speed setpoint (p1961) or suppression (skip) bandwidths (p1091 ... p1092, p1101).

For fault value = 8:

- adapt the speed setpoint (p1961) or maximum limit (p1082, p1083 and p1086).

For fault value = 9, 10:

- the measurement was carried out at an operating point where the load torque is too high. Select a more suitable operating point, either by changing the speed setpoint (p1961) or by reducing the load torque. The load torque may not be varied while making measurements.

Note:

The saturation characteristic identification routine can be disabled using p1959.1.

### Drive: Speed controller optimization, moment of inertia

**Message class:**

Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:**

OFF1 (NONE, OFF2)

**Acknowledge:**

IMMEDIATELY

**Cause:**

A fault has occurred while identifying the moment of inertia.

Fault value (r0949, interpret decimal):

- 1: The speed did not reach a steady-state condition.
- 2: The speed setpoint was not able to be approached as the minimum limiting is active.
- 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.
- 4: The speed setpoint was not able to be approached as the maximum limiting is active.
- 5: It is not possible to increase the speed by 10% as the minimum limiting is active.
- 6: It is not possible to increase the speed by 10% as the suppression (skip) bandwidth is active.
- 7: It is not possible to increase the speed by 10% as the maximum limiting is active.
- 8: The torque difference after the speed setpoint step is too low in order to be able to still reliably identify the moment of inertia.
- 9: Too few data to be able to reliably identify the moment of inertia.
- 10: After the setpoint step, the speed either changed too little or in the incorrect direction.
- 11: The identified moment of inertia is not plausible. The measured moment of inertia is less than the 0.1x or greater than 500x the preset moment of inertia of the motor p0341.

**Remedy:**

For fault value = 1:

- check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.
- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.
- carry out a motor data identification routine (p1910).
- if required, reduce the dynamic factor (p1967 < 25 %).

For fault value = 2, 5:

- adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).

For fault value = 3, 6:

- adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101).

For fault value = 4, 7:

- adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086).

For fault value = 8:

- the total drive moment of inertia is far higher than that of the motor (refer to p0341, p0342). De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.

For fault value = 9:

- check the moment of inertia (p0341, p0342). After the change, re-calculate (p0340 = 3 or 4).

For fault value = 10:

- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.

For fault value = 11:

- reduce the moment of inertia of the motor p0341 (e.g. factor of 0.2) or increase (e.g. factor of 5) and repeat the measurement.

Note:

The moment of inertia identification routine can be disabled using p1959.2.

<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2 (NONE, OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A fault has occurred during the identification routine. Fault value (r0949, interpret decimal): 1: Current limit value reached. 2: Identified stator resistance lies outside the expected range 0.1 ... 100% of Zn. 3: Identified rotor resistance lies outside the expected range 0.1 ... 100% of Zn. 4: identified stator reactance lies outside the expected range 50 ... 500 % of Zn. 5: identified magnetizing reactance lies outside the expected range 50 ... 500 % of Zn. 6: Identified rotor time constant lies outside the expected range 10 ms ... 5 s. 7: identified total leakage reactance lies outside the expected range 4 ... 50 % of Zn. 8: Identified stator leakage reactance lies outside the expected range 2 ... 50% of Zn. 9: Identified rotor leakage reactance lies outside the expected range 2 ... 50% of Zn. 10: Motor has been incorrectly connected. 11: Motor shaft rotates. 12: Ground fault detected. 15: Pulse inhibit occurred during motor data identification. 20: Identified threshold voltage of the semiconductor devices lies outside the expected range 0 ... 10 V. 30: Current controller in voltage limiting. 40: At least one identification contains errors. The identified parameters are not saved to prevent inconsistencies. Note: Percentage values are referred to the rated motor impedance: $Z_n = V_{mot,nom} / \sqrt{3} / I_{mot,nom}$
<b>Remedy:</b>	For fault value = 1 ... 40: - check whether motor data have been correctly entered in p0300, p0304 ... p0311. - is there an appropriate relationship between the motor power rating and that of the power unit? The ratio of the power unit to the rated motor current should not be less than 0.5 and not be greater than 4. - check connection type (star-delta). For fault value = 4, 7: - check whether the inductance in p0233 is correctly set. - check whether motor has been correctly connected (star-delta). For fault value = 11 in addition: - deactivate oscillation monitoring (p1909.7 = 1). For fault value = 12: - check the power cable connections. - check the motor. - check the CT.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A07991 (N)</b>	<b>Drive: Motor data identification activated</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The motor data identification routine is activated. The motor data identification routine is carried out at the next switch-on command. If rotating measurement is selected (see p1900, p1960), it will not be possible to save the parameter assignment. Once motor data identification has been completed or deactivated, the option to save the parameter assignment will be made available again. See also: p1910 (Motor data identification selection)
<b>Remedy:</b>	Not necessary. The alarm automatically disappears after the motor data identification routine has been successfully completed or for the setting p1900 = 0.

---

<b>A07994 (F, N)</b>	<b>Drive: motor data identification not performed</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The "vector control" mode has been selected and a motor data identification has still not been performed. The alarm is initiated when changing the drive data set (see r0051) in the following cases: - vector control is parameterized in the actual drive data set (p1300 >= 20). and - motor data identification has still not been performed in the actual drive data set (see r3925). Note: For SINAMICS G120, a check is made and an alarm is output also when exiting commissioning and when the system powers up.
<b>Remedy:</b>	- Perform motor data identification (see p1900). - if required, parameterize "U/f control" (p1300 < 20) or set p0096 = 0 (only G120). - switch over to a drive data set, in which the conditions do not apply.

<b>F08501 (N, A)</b>	<b>PROFINET: Setpoint timeout</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The reception of setpoints from PROFINET has been interrupted. - bus connection interrupted. - controller switched off. - controller set into the STOP state.
<b>Remedy:</b>	- Restore the bus connection and set the controller to RUN. - if the error is repeated, check the update time set in the bus configuration (HW Config).

---

<b>F08502 (A)</b>	<b>PROFINET: Monitoring time sign-of-life expired</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The monitoring time for the sign-of-life counter has expired. The connection to the PROFINET interface was interrupted.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- contact Technical Support.

**A08511 (F)      PROFINET: Receive configuration data invalid**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The drive unit did not accept the receive configuration data.  
Alarm value (r2124, interpret decimal):  
Return value of the receive configuration data check.  
2: Too many PZD data words for output or input to a drive object. Maximum of 12 words are possible.  
3: Uneven number of bytes for input or output.  
501: PROFIsafe parameter error (e.g. F\_dest).

**Remedy:** Check the receive configuration data.  
For alarm value = 2:  
- Check the number of data words for output and input to a drive object.  
For alarm value = 501:  
- check the set PROFIsafe address (p9610).

---

**A08526 (F)      PROFINET: No cyclic connection**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** There is no connection to a PROFINET controller.

**Remedy:** Establish the cyclic connection and activate the controller with cyclic operation.  
Check the parameters "Name of Station" and "IP of Station" (r61000, r61001).

---

**A08564      PN/COMM BOARD: syntax error in the configuration file**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A syntax error has been detected in the ASCII configuration file for the Communication Board Ethernet. The saved configuration file has not been loaded.

**Remedy:** - correct the PROFINET interface configuration (p8920 and following) and activate (p8925 = 2).  
- reinitialize the station (e.g. using the STARTER commissioning software)  
Note:  
The configuration is not applied until the next POWER ON!

#### **CAN: Communications error**

**Message class:** Communication error to the higher-level control system (9)

**Reaction:** OFF3 (NONE, OFF1, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A CAN communications error has occurred.

Fault value (r0949, interpret decimal):

1: The error counter for the send telegrams has exceeded the BUS OFF value 255. The bus disables the CAN controller.

- bus cable short circuit.
- incorrect baud rate.
- incorrect bit timing.

2: The master no longer interrogated the CAN node status longer than for its "life time". The "life time" is obtained from the "guard time" (p8604[0]) multiplied by the "life time factor" (p8604[1]).

- bus cable interrupted.
- bus cable not connected.
- incorrect baud rate.
- incorrect bit timing.
- master fault.

**Note:**

The fault response can be set as required using p8641.

See also: p8604 (CAN life guarding), p8641 (CAN Abort Connection Option Code)

**Remedy:**

- check the bus cable
- check the baud rate (p8622).
- check the bit timing (p8623).
- check the master.

The CAN controller must be manually restarted with p8608 = 1 after the cause of the fault has been resolved!

**Message class:** Communication error to the higher-level control system (9)

**Reaction:** OFF3

**Acknowledge:** IMMEDIATELY

**Cause:** A CANopen NMT state transition from "operational" to "pre-operational" or after "stopped".

Fault value (r0949, interpret decimal):

1: CANopen NMT state transition from "operational" to "pre-operational".

2: CANopen NMT state transition from "operational" to "stopped".

**Note:**

In the NMT state "pre-operational", process data cannot be transferred and in the NMT state "stopped", no process data and no service data can be transferred.

**Remedy:**

Not necessary.

Acknowledge the fault and continue operation.

#### F08702 (A)

#### **CAN: RPDO Timeout**

**Message class:** Communication error to the higher-level control system (9)

**Reaction:** OFF3 (NONE, OFF1, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The monitoring time of the CANopen RPDO telegram has expired because the bus connection was either interrupted or the CANopen Master was switched-off.

See also: p8699 (CAN: RPDO monitoring time)

**Remedy:**

- check the bus cable
- check the master.
- If required, increase the monitoring time (p8699).

---

**A08751 (N) CAN: Telegram loss**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The CAN controller has lost a receive message (telegram).  
**Remedy:** Reduce the cycle times of the receive messages.

---

**A08752 CAN: Error counter for error passive exceeded**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The error counter for the send or receive telegrams has exceeded the value 127.  
**Remedy:**

- check the bus cable
- set a higher baud rate (p8622).
- check the bit timing and if required optimize (p8623).

See also: p8622 (CAN bit rate), p8623 (CAN Bit Timing selection)

---

**A08753 CAN: Message buffer overflow**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A message buffer overflow.  
Alarm value (r2124, interpret decimal):  
1: Non-cyclic send buffer (SDO response buffer) overflow.  
2: Non-cyclic receive buffer (SDO receive buffer) overflow.  
3: Cyclic send buffer (PDO send buffer) overflow.  
**Remedy:**

- check the bus cable.
- set a higher baud rate (p8622).
- check the bit timing and if required optimize (p8623).

For alarm value = 2:

- reduce the cycle times of the SDO receive messages.
- SDO request from master only after SDO feedback for previous SDO request.

**A08754 CAN: Incorrect communications mode**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** In the "operational" mode, an attempt was made to change parameters p8700 ... p8737.  
**Remedy:** Change to the "pre-operational" or "stopped" mode.

---

**A08755 CAN: Object cannot be mapped**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The CANopen object is not provided for the Process Data Object (PDO) Mapping.  
**Remedy:** Use a CANopen object intended for the PDO mapping or enter 0.  
The following objects can be mapped in the Receive Process Data Object (RPDO) or Transmit Process Data Object (TPDO):

- RPDO: 6040 hex, 6060 hex, 60FF hex, 6071 hex; 5800 hex - 580F hex; 5820 hex - 5827 hex
- TPDO: 6041 hex, 6061 hex, 6063 hex, 6069 hex, 606B hex, 606C hex, 6074 hex; 5810 hex - 581F hex; 5830 hex - 5837 hex

## 4 Faults and alarms

### 4.2 List of faults and alarms

Only sub-index 0 of the specified objects can be mapped.

Note:

As long as A08755 is present, the COB-ID cannot be set to valid.

---

**A08756**      **CAN: Number of mapped bytes exceeded**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The number of bytes of the mapped objects exceeds the telegram size for net data. A max. of 8 bytes is permissible.  
**Remedy:** Map fewer objects or objects with a smaller data type.  
See also: p8710, p8711, p8712, p8713, p8714, p8715, p8716, p8717, p8730, p8731, p8732, p8733, p8734, p8735, p8736, p8737

---

**A08757**      **CAN: Set COB-ID invalid**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For online operation, the appropriate COB-ID must be set invalid before mapping.  
Example:  
Mapping for RPDO 1 should be changed (p8710[0]).  
--> set p8700[0] = C00006E0 hex (invalid COB-ID)  
--> set p8710[0] as required.  
--> p8700[0] enter a valid COB-ID  
**Remedy:** Set the COB-ID to invalid.

---

**A08759**      **CAN: PDO COB-ID already available**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An existing PDO COB-ID was allocated.  
**Remedy:** Select another PDO COB-ID.

---

**A08760**      **CAN: maximum size of the IF PZD exceeded**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The maximum size of the IF PZD was exceeded.  
Alarm value (r2124, interpret decimal):  
1: error for IF PZD receive.  
2: error for IF PZD send.  
Note:  
IF: interface  
**Remedy:** Map fewer process data in PDO.  
Apply one of the following options to delete the alarm:  
- POWER ON (switch-off/switch-on).  
- carry out a warm restart (p0009 = 30, p0976 = 2).  
- execute CANopen NMT command reset node.  
- change CANopen NMT state.  
- delete alarm buffer [0...7] (p2111 = 0).

<b>A08800</b>	<b>PROFenergy energy-saving mode active</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The PROFenergy energy-saving mode is active Alarm value (r2124, interpret decimal): Mode ID of the active PROFenergy energy-saving mode. See also: r5600 (Pe energy-saving mode ID)
<b>Remedy:</b>	The alarm is automatically withdrawn when the energy-saving mode is exited. Note: The energy-saving mode is exited after the following events: - the PROFenergy command end_pause is received from the higher-level control. - the higher-level control has changed into the STOP operating state. - the PROFINET connection to the higher-level control has been disconnected.

<b>F13009</b>	<b>Licensing OA application not licensed</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	At least one OA application which is under license does not have a license. Note: Refer to r4955 and p4955 for information about the installed OA applications.
<b>Remedy:</b>	- enter and activate the license key for OA applications under license (p9920, p9921). - if necessary, de-activate unlicensed OA applications (p4956).

<b>F13100</b>	<b>Know-how protection: Copy protection error</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The know-how protection with copy protection for the memory card is active. An error has occurred when checking the memory card. Fault value (r0949, interpret decimal): 0: A memory card is not inserted. 1: An invalid memory card is inserted (not SIEMENS). 2: An invalid memory card is inserted. 3: The memory card is being used in another Control Unit. 12: An invalid memory card is inserted (OEM input incorrect, p7769). 13: The memory card is being used in another Control Unit (OEM input incorrect, p7759). See also: p7765 (KHP configuration)
<b>Remedy:</b>	For fault value = 0, 1: - insert the correct memory card and carry out POWER ON. For fault value = 2, 3, 12, 13: - contact the responsible OEM. - Deactivate copy protection (p7765) and acknowledge the fault (p3981). - Deactivate know-how protection (p7766 ... p7768) and acknowledge the fault (p3981). Note: In general, the copy protection can only be changed when know-how protection is deactivated. KHP: Know-How Protection See also: p3981 (Acknowledge drive object faults), p7765 (KHP configuration)

---

**F13101      Know-how protection: Copy protection cannot be activated**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** An error occurred when attempting to activate the copy protection for the memory card.  
Fault value (r0949, interpret decimal):  
0: A memory card is not inserted.  
1: An invalid memory card is inserted (not SIEMENS).  
Note:  
KHP: Know-How Protection  
**Remedy:** - insert a valid memory card.  
- Try to activate copy protection again (p7765).  
See also: p7765 (KHP configuration)

---

**F13102      Know-how protection: Consistency error of the protected data**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** OFF1  
**Acknowledge:** IMMEDIATELY  
**Cause:** An error was identified when checking the consistency of the protected files. As a consequence, the project on the memory card cannot be run.  
Fault value (r0949, interpret hexadecimal):  
yyyyxxxx hex: yyyy = object number, xxxx = fault cause  
xxxx = 1:  
A file has a checksum error.  
xxxx = 2:  
The files are not consistent with one another.  
xxxx = 3:  
The project files, which were loaded into the file system via load (download from the memory card), are inconsistent.  
Note:  
KHP: Know-How Protection  
**Remedy:** - Replace the project on the memory card or replace project files for download from the memory card.  
- Restore the factory setting and download again.

**F30001      Power unit: Overcurrent**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The power unit has detected an overcurrent condition.  
- closed-loop control is incorrectly parameterized.  
- motor has a short-circuit or fault to ground (frame).  
- U/f operation: Up ramp set too low.  
- U/f operation: rated current of motor much greater than that of power unit.  
- High discharge and post-charging current for line supply voltage interruptions.  
- High post-charging currents for overload when motoring and DC link voltage dip.  
- short-circuit currents at switch-on due to the missing line reactor.  
- power cables are not correctly connected.  
- power cables exceed the maximum permissible length.  
- power unit defective.  
- line phase interrupted.  
Fault value (r0949, interpret bitwise binary):  
Bit 0: Phase U.  
Bit 1: Phase V.  
Bit 2: Phase W.  
Bit 3: Overcurrent in the DC link.

Note:

Fault value = 0 means that the phase with overcurrent is not recognized.

**Remedy:**

- check the motor data - if required, carry out commissioning.
- check the motor circuit configuration (star/delta).
- U/f operation: Increase up ramp.
- U/f operation: Check assignment of rated currents of motor and power unit.
- check the line supply quality.
- reduce motor load.
- correct connection of line reactor.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.
- check the line supply phases.

---

**F30002 Power unit: DC link voltage overvoltage**

**Message class:** DC link overvoltage (4)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an overvoltage condition in the DC link.

- motor regenerates too much energy.
- line supply voltage too high.
- line phase interrupted.
- DC link voltage control switched off.
- dynamic response of DC link voltage controller excessive or insufficient.

Fault value (r0949, interpret decimal):

DC link voltage at the time of trip [0.1 V].

**Remedy:**

- increase the ramp-down time (p1121).
  - set the rounding times (p1130, p1136). This is particularly recommended in U/f operation to relieve the DC link voltage controller with rapid ramp-down times of the ramp-function generator.
  - Activate the DC link voltage controller (p1240, p1280).
  - adapt the dynamic response of the DC link voltage controller (p1243, p1247, p1283, p1287).
  - check the line supply and DC link voltage. set p0210 as low as possible (also see A07401, p1294 = 0).
  - check and correct the phase assignment at the power unit.
  - check the line supply phases.
- See also: p0210 (Drive unit line supply voltage), p1240 (Vdc controller configuration (vector control))

---

**F30003 Power unit: DC link voltage undervoltage**

**Message class:** Infeed faulted (13)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an undervoltage condition in the DC link.

- line supply failure
- line supply voltage below the permissible value.
- line phase interrupted.

Note:

The monitoring threshold for the DC link undervoltage is the minimum of the following values:

- for a calculation, refer to p0210.

**Remedy:**

- check the line supply voltage
  - check the line supply phases.
- See also: p0210 (Drive unit line supply voltage)

---

**F30004 Power unit: Overtemperature heat sink AC inverter**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The temperature of the power unit heat sink has exceeded the permissible limit value.  
- insufficient cooling, fan failure.  
- overload.  
- ambient temperature too high.  
- pulse frequency too high.  
Fault value (r0949, interpret decimal):  
Temperature [1 bit = 0.01 °C].  
**Remedy:**  
- check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
- check the motor load.  
- reduce the pulse frequency if this is higher than the rated pulse frequency.  
Notice:  
This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.  
See also: p1800 (Pulse frequency setpoint)

---

**F30005 Power unit: Overload I2t**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The power unit was overloaded (r0036 = 100 %).  
- the permissible rated power unit current was exceeded for an inadmissibly long time.  
- the permissible load duty cycle was not maintained.  
Fault value (r0949, interpret decimal):  
I2t [100 % = 16384].  
**Remedy:**  
- reduce the continuous load.  
- adapt the load duty cycle.  
- check the motor and power unit rated currents.  
- reduce the current limit (p0640).  
- during operation with U/f characteristic: reduce the integral time of the current limiting controller (p1341).  
See also: r0036 (Power unit overload I2t), r0206 (Rated power unit power), p0307 (Rated motor power)

---

**F30011 Power unit: Line phase failure in main circuit**

**Message class:** Network fault (2)  
**Reaction:** OFF2 (OFF1)  
**Acknowledge:** IMMEDIATELY  
**Cause:** At the power unit, the DC link voltage ripple has exceeded the permissible limit value.  
Possible causes:  
- a line phase has failed.  
- the 3 line phases are inadmissibly asymmetrical.  
- the capacitance of the DC link capacitor forms a resonance frequency with the line inductance and the reactor integrated in the power unit.  
- the fuse of a phase of a main circuit has ruptured.  
- a motor phase has failed.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- check the main circuit fuses.
- check whether a single-phase load is distorting the line voltages.
- Detune the resonant frequency with the line inductance by using an upstream line reactor.
- Dampen the resonant frequency with the line inductance by switching over the DC link voltage compensation in the software (see p1810) – or increase the smoothing (see p1806). However, this can have a negative impact on the torque ripple at the motor output.
- check the motor feeder cables.

**F30012 Power unit: Temperature sensor heat sink wire breakage**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF1 (OFF2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The connection to a heat sink temperature sensor in the power unit is interrupted.  
 Fault value (r0949, interpret hexadecimal):  
 Bit 0: Module slot (electronics slot)  
 Bit 1: Air intake  
 Bit 2: Inverter 1  
 Bit 3: Inverter 2  
 Bit 4: Inverter 3  
 Bit 5: Inverter 4  
 Bit 6: Inverter 5  
 Bit 7: Inverter 6  
 Bit 8: Rectifier 1  
 Bit 9: Rectifier 2

**Remedy:** Contact the manufacturer.

---

**F30013 Power unit: Temperature sensor heat sink short-circuit**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF1 (OFF2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The heat sink temperature sensor in the power unit is short-circuited.  
 Fault value (r0949, interpret hexadecimal):  
 Bit 0: Module slot (electronics slot)  
 Bit 1: Air intake  
 Bit 2: Inverter 1  
 Bit 3: Inverter 2  
 Bit 4: Inverter 3  
 Bit 5: Inverter 4  
 Bit 6: Inverter 5  
 Bit 7: Inverter 6  
 Bit 8: Rectifier 1  
 Bit 9: Rectifier 2

**Remedy:** Contact the manufacturer.

---

**F30015 (N, A) Power unit: Phase failure motor cable**

**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF2 (NONE, OFF1, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A phase failure in the motor feeder cable was detected.  
 The signal can also be output in the following cases:

- the motor is correctly connected, but the drive has stalled in U/f control. In this case, a current of 0 A is possibly measured in one phase due to asymmetry of the currents.
- the motor is correctly connected, however the closed-speed control is instable and therefore an oscillating torque is generated.

**Note:**  
 Chassis power units do not feature phase failure monitoring.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

- Remedy:**
- check the motor feeder cables.
  - increase the ramp-up or ramp-down time (p1120) if the drive has stalled in U/f control.
  - check the speed controller settings.

---

#### **A30016 (N) Power unit: Load supply switched out**

**Message class:** Network fault (2)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The DC link voltage is too low.  
Alarm value (r2124, interpret decimal):  
DC link voltage at the time of trip [0.1 V].

**Remedy:** Under certain circumstances, the AC line supply is not switched on.

---

#### **F30017 Power unit: Hardware current limit has responded too often**

**Message class:** Power electronics faulted (5)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Fault value (r0949, interpret binary):  
Bit 0: Phase U  
Bit 1: Phase V  
Bit 2: Phase W

**Remedy:**

- check the motor data.
- check the motor circuit configuration (star-delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

---

#### **F30021 Power unit: Ground fault**

**Message class:** Ground fault / inter-phase short-circuit detected (7)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power has detected a ground fault.  
Possible causes:

- ground fault in the power cables.
- ground fault at the motor.
- CT defective.
- when the brake closes, this causes the hardware DC current monitoring to respond.
- short-circuit at the braking resistor.

Fault value (r0949, interpret decimal):  
0:  
- the hardware DC current monitoring has responded.  
- short-circuit at the braking resistor.  
> 0:  
Absolute value, summation current [32767 = 271 % rated current].

- Remedy:**
- check the power cable connections.
  - check the motor.
  - check the CT.
  - check the cables and contacts of the brake connection (a wire is possibly broken).
  - check the braking resistor.
- See also: p0287 (Ground fault monitoring thresholds)

---

**F30022**      **Power unit: Monitoring U<sub>ce</sub>**

**Message class:** Ground fault / inter-phase short-circuit detected (7)

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** In the power unit, the monitoring of the collector-emitter voltage (U<sub>ce</sub>) of the semiconductor has responded.

Possible causes:

- fiber-optic cable interrupted.
- power supply of the IGBT gating module missing.
- short-circuit at the power unit output.
- defective semiconductor in the power unit.

Fault value (r0949, interpret binary):

Bit 0: Short-circuit in phase U

Bit 1: Short circuit in phase V

Bit 2: Short-circuit in phase W

Bit 3: Light transmitter enable defective

Bit 4: U<sub>ce</sub> group fault signal interrupted

See also: r0949 (Fault value)

- Remedy:**
- check the fiber-optic cable and if required, replace.
  - check the power supply of the IGBT gating module (24 V).
  - check the power cable connections.
  - select the defective semiconductor and replace.

---

**F30024**      **Power unit: Overtemperature thermal model**

**Message class:** Power electronics faulted (5)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature difference between the heat sink and chip has exceeded the permissible limit value.

- the permissible load duty cycle was not maintained.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

See also: r0037 (Power unit temperatures)

- Remedy:**
- adapt the load duty cycle.
  - check whether the fan is running.
  - check the fan elements.
  - check whether the ambient temperature is in the permissible range.
  - check the motor load.
  - reduce the pulse frequency if this is higher than the rated pulse frequency.
  - if DC braking is active: reduce braking current (p1232).

See also: p0210 (Drive unit line supply voltage)

**Remedy:**

In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).
- wait until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

For 5):

- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).

For 6):

- check the capacitance of the DC link and, if necessary, reduce it in accordance with the maximum permissible DC link capacitance (see relevant Equipment Manual).

For 7):

- check the DC link for a ground fault or short circuit.

**A30030 Power unit: Internal overtemperature alarm**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature inside the drive converter has exceeded the permissible temperature limit.

- insufficient cooling, fan failure.
- overload.

- ambient temperature too high.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- possibly use an additional fan.
- check whether the ambient temperature is in the permissible range.

Notice:

This fault can only be acknowledged once the permissible temperature limit minus 5 K has been fallen below.

---

**A30031 Power unit: Hardware current limiting in phase U**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Hardware current limit for phase U responded. The pulsing in this phase is inhibited for one pulse period.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Note:

Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.

- Remedy:**
- check the motor data and if required, recalculate the control parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
  - check the motor circuit configuration (star/delta).
  - check the motor load.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.

---

#### **A30032 Power unit: Hardware current limiting in phase V**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Hardware current limit for phase V responded. The pulsing in this phase is inhibited for one pulse period.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

**Note:**

Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.

**Remedy:** Check the motor data and if required, recalculate the control parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).

- check the motor circuit configuration (star/delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.

---

#### **A30033 Power unit: Hardware current limiting in phase W**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Hardware current limit for phase W responded. The pulsing in this phase is inhibited for one pulse period.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

**Note:**

Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.

**Remedy:** Check the motor data and if required, recalculate the control parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).

- check the motor circuit configuration (star/delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.

---

#### **A30034 Power unit: Internal overtemperature**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The alarm threshold for internal overtemperature has been reached.

If the temperature inside the unit continues to increase, fault F30036 may be triggered.

- ambient temperature might be too high.
- insufficient cooling, fan failure.

Alarm value (r2124, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- check the ambient temperature.  
- check the fan for the inside of the unit.

---

**F30035 Power unit: Air intake overtemperature**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF1 (OFF2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The air intake in the power unit has exceeded the permissible temperature limit.  
For air-cooled power units, the temperature limit is at 55 °C.  
- ambient temperature too high.  
- insufficient cooling, fan failure.  
Fault value (r0949, interpret decimal):  
Temperature [0.01 °C].  
**Remedy:**  
- check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
Notice:  
This fault can only be acknowledged after the alarm threshold for alarm A05002 has been undershot.

---

**F30036 Power unit: Internal overtemperature**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The temperature inside the drive converter has exceeded the permissible temperature limit.  
- insufficient cooling, fan failure.  
- overload.  
- ambient temperature too high.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
Notice:  
This fault can only be acknowledged once the permissible temperature limit minus 5 K has been fallen below.

---

**F30037 Power unit: Rectifier overtemperature**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The temperature in the rectifier of the power unit has exceeded the permissible temperature limit.  
- insufficient cooling, fan failure.  
- overload.  
- ambient temperature too high.  
- line supply phase failure.  
Fault value (r0949, interpret decimal):  
Temperature [0.01 °C].  
**Remedy:**  
- check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
- check the motor load.  
- check the line supply phases.  
Notice:  
This fault can only be acknowledged after the alarm threshold for alarm A05004 has been undershot.

<b>A30042</b>	<b>Power unit: Fan has reached the maximum operating hours</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The maximum operating time of at least one fan will soon be reached, or has already been exceeded. Alarm value (r2124, interpret binary): Bit 0: heat sink fan will reach the maximum operating time in 500 hours. Bit 1: heat sink fan has exceeded the maximum operating time. Bit 8: internal device fan will reach the maximum operating time in 500 hours. Bit 9: internal device fan has exceeded the maximum operating time. Note: The maximum operating time of the heat sink fan in the power unit is displayed in p0252. The maximum operating time of the internal device fan in the power unit is internally specified and is fixed.
<b>Remedy:</b>	For the fan involved, carry out the following: - replace the fan. - reset the operating hours counter (p0251, p0254).

---

<b>A30049</b>	<b>Power unit: Internal fan faulty</b>
<b>Message class:</b>	Auxiliary unit faulted (20)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The internal fan has failed.
<b>Remedy:</b>	Check the internal fan and replace if necessary.

---

<b>F30051</b>	<b>Power unit: Motor holding brake short circuit detected</b>
<b>Message class:</b>	External measured value / signal state outside the permissible range (16)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A short-circuit at the motor holding brake terminals has been detected. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- check the motor holding brake for a short-circuit. - check the connection and cable for the motor holding brake.

---

<b>F30052</b>	<b>EEPROM data error</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	EEPROM data error of the power unit module. Fault value (r0949, interpret decimal): 0, 2, 3, 4: The EEPROM data read in from the power unit module is inconsistent. 1: EEPROM data is not compatible to the firmware of the Control Unit.
<b>Remedy:</b>	Replace power unit module.

---

<b>A30054 (F, N)</b>	<b>Power unit: Undervoltage when opening the brake</b>
<b>Message class:</b>	Supply voltage fault (undervoltage) (3)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When the brake is being opened, it is detected that the power supply voltage is less than 21.4 V Alarm value (r2124, interpret decimal): Supply voltage fault [0.1 V]. Example: Alarm value = 195 --> voltage = 19.5 V

**Remedy:** Check the 24 V voltage for stability and value.

---

**F30055 Power unit: Braking chopper overcurrent**

**Message class:** Braking Module faulted (14)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** An overcurrent condition has occurred in the braking chopper.

**Remedy:** - check whether the braking resistor has a short circuit.  
- for an external braking resistor, check whether the resistor may have been dimensioned too small.

**Note:**

The braking chopper is only enabled again at pulse enable after the fault has been acknowledged.

---

**A30057 Power unit: Line asymmetry**

**Message class:** Network fault (2)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed.

Fault F30011 is output if the alarm is present and at the latest after 5 minutes.

The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:** - check the line phase connection.  
- check the motor feeder cable connections.  
If there is no phase failure of the line or motor, then line asymmetry is involved.  
- reduce the power in order to avoid fault F30011.

---

**F30059 Power unit: Internal fan faulty**

**Message class:** Auxiliary unit faulted (20)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The internal power unit fan has failed and is possibly defective.

**Remedy:** Check the internal fan and replace if necessary.

---

**A30065 (F, N) Voltage measured values not plausible**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The voltage measurement is not supplying any plausible values

Alarm value (r2124, interpret bitwise binary):

Bit 1: Phase U.

Bit 2: Phase V.

Bit 3: Phase W.

**Remedy:** - Deactivate voltage measurement (p0247.0 = 0).  
- Deactivate flying restart with voltage measurement (p0247.5 = 0) and deactivate fast flying restart (p1780.11 = 0).

---

**F30071 No new actual values received from the Power Module**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** More than one actual value telegram from the power unit module has failed.

**Remedy:** Check the interface (adjustment and locking) to the power unit module.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>F30072</b>	<b>Setpoints can no longer be transferred to the Power Module</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	More than one setpoint telegram was not able to be transferred to the power unit module.
<b>Remedy:</b>	Check the interface (adjustment and locking) to the power unit module.

---

<b>F30074 (A)</b>	<b>Communication error between the Control Unit and Power Module</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Communications between the Control Unit (CU) and Power Module (PM) via the interface no longer possible. The CU may have been withdrawn or is incorrectly inserted. Fault value (r0949, interpret hexadecimal): 0 hex: - a Control Unit with external 24 V supply was withdrawn from the Power Module during operation. - with the Power Module switched off, the external 24 V supply for the Control Unit was interrupted for some time. 1 hex: The Control Unit was withdrawn from the Power Module during operation, although the encoderless safe motion monitoring functions are enabled. This is not supported. After re-inserting the Control Unit in operation, communications to the Power Module no longer possible. 20A hex: The Control Unit was inserted on a Power Module, which has another code number. 20B hex: The Control Unit was inserted on a Power Module, which although it has the same code number, has a different serial number. The Control Unit executes an automatic warm restart to accept the new calibration data.
<b>Remedy:</b>	For fault value = 0 and 20A hex: Insert the Control Unit on an appropriate Power Module and continue operation. If required, carry out a POWER ON of the Control Unit. For fault value = 1 hex: Carry out a POWER ON of the Control Unit.

---

<b>F30075</b>	<b>Configuration of the power unit unsuccessful</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A communication error has occurred while configuring the power unit using the Control Unit. The cause is not clear. Fault value (r0949, interpret decimal): 0: The output filter initialization was unsuccessful. 1: Activation/deactivation of the regenerative feedback functionality was unsuccessful.
<b>Remedy:</b>	- acknowledge the fault and continue operation. - if the fault reoccurs, carry out a POWER ON (switch-off/switch-on). - if required, replace the power unit.

---

<b>F30080</b>	<b>Power unit: Current increasing too quickly</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The power unit has detected an excessive rate of rise in the overvoltage range. - closed-loop control is incorrectly parameterized. - motor has a short-circuit or fault to ground (frame). - U/f operation: Up ramp set too low. - U/f operation: rated current of motor much greater than that of power unit. - power cables are not correctly connected.

- power cables exceed the maximum permissible length.
- power unit defective.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.

Bit 1: Phase V.

Bit 2: Phase W.

**Remedy:**

- check the motor data - if required, carry out commissioning.
- check the motor circuit configuration (star-delta)
- U/f operation: Increase up ramp.
- U/f operation: Check assignment of rated currents of motor and power unit.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

---

**F30081 Power unit: Switching operations too frequent**

**Message class:** Power electronics faulted (5)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has executed too many switching operations for current limitation.

- closed-loop control is incorrectly parameterized.
- motor has a short-circuit or fault to ground (frame).
- U/f operation: Up ramp set too low.
- U/f operation: rated current of motor much greater than that of power unit.
- power cables are not correctly connected.
- power cables exceed the maximum permissible length.
- power unit defective.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.

Bit 1: Phase V.

Bit 2: Phase W.

**Remedy:**

- check the motor data - if required, carry out commissioning.
- check the motor circuit configuration (star-delta)
- U/f operation: Increase up ramp.
- U/f operation: Check assignment of rated currents of motor and power unit.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

---

**F30105 PU: Actual value sensing fault**

**Message class:** Power electronics faulted (5)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** At least one incorrect actual value channel was detected on the Power Stack Adapter (PSA).

The incorrect actual value channels are displayed in the following diagnostic parameters.

**Remedy:**

Evaluate the diagnostic parameters.

If the actual value channel is incorrect, check the components and if required, replace.

---

**A30502 Power unit: DC link overvoltage**

**Message class:** DC link overvoltage (4)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The power unit has detected overvoltage in the DC link on a pulse inhibit.  
- device connection voltage too high.  
- line reactor incorrectly dimensioned.  
Alarm value (r0949, interpret decimal):  
DC link voltage [1 bit = 100 mV].  
See also: r0070 (Actual DC link voltage)  
**Remedy:** - check the device supply voltage (p0210).  
- check the dimensioning of the line reactor.  
See also: p0210 (Drive unit line supply voltage)

---

**F30600 SI P2: STOP A initiated**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The drive-integrated "Safety Integrated" function on processor 2 has detected an error and initiated a STOP A.  
- forced checking procedure (test stop) of the safety switch-off signal path on processor 2 unsuccessful.  
- subsequent response to fault F30611 (defect in a monitoring channel).  
Fault value (r0949, interpret decimal):  
0: Stop request from processor 1.  
1005: Pulses suppressed although STO not selected and there is no internal STOP A present.  
1010: Pulses enabled although STO is selected or an internal STOP A is present.  
1011: Internal fault for the pulse enable in the Power Module.  
9999: Subsequent response to fault F30611.  
**Remedy:** - select Safe Torque Off and de-select again.  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- replace Power Module involved.  
For fault value = 9999:  
- carry out diagnostics for fault F30611.  
Note:  
PM: Power Module  
STO: Safe Torque Off

---

**F30611 (A) SI P2: Defect in a monitoring channel**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** NONE (OFF1, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The drive-integrated "Safety Integrated" function on processor 2 has detected a fault in the data cross-check between the two monitoring channels and has initiated a STOP F.  
As a consequence of this fault, fault F30600 (SI P2: STOP A initiated) is output.  
Fault value (r0949, interpret decimal):  
0: Stop request from the other monitoring channel.  
1 ... 999:  
Number of the cross-compared data that resulted in this fault. This number is also displayed in r9795.  
2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.  
3: SI F-DI changeover discrepancy time (p9650, p9850).  
8: SI PROFIsafe address (p9610, p9810).  
9: SI debounce time for STO (p9651, p9851).  
1000: Watchdog timer has expired.

Within the time of approx. 5 x p9650, alternatively, the following was defined:

- the signal at F-DI continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850).
- via PROFIsafe, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).

1001, 1002: Initialization error, change timer / check timer.

2000: Status of the STO selection for both monitoring channels are different.

2001: Feedback signal of the safe pulse suppression for both monitoring channels different.

2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850).

2003: Status of the STO terminal for processor 1 and processor 2 different.

6000 ... 6999:

Error in the PROFIsafe control.

For these fault values, the fail-safe control signals (fail-safe values) are transferred to the safety functions.

The significance of the individual message values is described in safety fault F01611.

#### Remedy:

For fault values 1 ... 999 described in "Cause":

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on).

For fault value = 1000:

- check the wiring of the F-DI (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on).

For fault value = 2000, 2001, 2002, 2003:

- check the discrepancy time, and if required, increase the value (p9650/p9850).
- check the wiring of the F-DI (contact problems).
- check the causes of the STO selection in r9772.

For fault value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

For fault values that are described in "Cause":

- carry out a POWER ON (switch-off/switch-on).
- contact Technical Support.
- replace Control Unit.

Note:

F-DI: Fail-safe Digital Input

STO: Safe Torque Off

---

### N30620 (F, A)

#### SI P2: Safe Torque Off active

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The "Safe Torque Off" (STO) function has been selected on processor 2 using the input terminal and is active.

Note:

This message does not result in a safety stop response.

**Remedy:** Not necessary.

Note:

STO: Safe Torque Off

---

### F30625

#### SI P2: Sign-of-life error in safety data

**Message class:** Hardware/software error (1)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive-integrated "Safety Integrated" function on processor 2 has detected an error in the sign-of-life of the safety data and initiated a STOP A.

- there is a communication error between processor 1 and processor 2 or communication has failed.
- a time slice overflow of the safety software has occurred.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- select Safe Torque Off and de-select again.
  - carry out a POWER ON (switch-off/switch-on).
  - check whether additional faults are present and if required, perform diagnostics.
  - check the electrical cabinet design and cable routing for EMC compliance
- 

**F30649**

**SI P2: Internal software error**

**Message class:**

Hardware/software error (1)

**Reaction:**

OFF2

**Acknowledge:**

IMMEDIATELY (POWER ON)

**Cause:**

An internal error in the Safety Integrated software on processor 2 has occurred.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
  - re-commission the "Safety Integrated" function and carry out a POWER ON.
  - contact Technical Support.
  - replace Control Unit.
- 

**F30650**

**SI P2: Acceptance test required**

**Message class:**

Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:**

OFF2

**Acknowledge:**

IMMEDIATELY (POWER ON)

**Cause:**

The drive-integrated "Safety Integrated" function on processor 2 requires an acceptance test.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

130: Safety parameters for processor 2 not available.

Note:

This fault value is always output when Safety Integrated is commissioned for the first time.

1000: Reference and actual checksum on processor 2 are not identical (booting).

- at least one checksum-checked piece of data is defective.

- safety parameters set offline and loaded into the Control Unit.

2000: Reference and actual checksum on processor 2 are not identical (commissioning mode).

- reference checksum incorrectly entered on processor 2 (p9899 not equal to r9898).

2003: Acceptance test is required as a safety parameter has been changed.

2010: Enable of safety-related brake control between the two monitoring channels differ (p9602 not equal to p9802).

9999: Subsequent response of another safety-related fault that occurred when booting that requires an acceptance test.

**Remedy:**

For fault value = 130:

- carry out safety commissioning routine.

For fault value = 1000:

- again carry out safety commissioning routine.

- replace the memory card or Control Unit.

- Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).

For fault value = 2000:

- check the safety parameters on processor 2 and adapt the reference checksum (p9899).

For fault value = 2003:

- carry out an acceptance test and generate an acceptance report.

For fault value = 2010:

- check the enable the safety-related brake control on both monitoring channels (p9602 = p9802).
-

For fault value = 9999:

- carry out diagnostics for the other safety-related fault that is present.

<b>F30651</b>	<b>SI P2: Synchronization with Control Unit unsuccessful</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive-integrated "Safety Integrated" function requires synchronization of the safety time slices on processor 1 and processor 2. This synchronization routine was unsuccessful. Note: This fault results in a STOP A that cannot be acknowledged. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	Carry out a POWER ON (switch-off/switch-on).

---

<b>F30655</b>	<b>SI P2: Align monitoring functions</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	An error has occurred when aligning the Safety Integrated monitoring functions on processor 1 and processor 2. No common set of supported SI monitoring functions was able to be determined. - there is a communication error between processor 1 and processor 2 or communication has failed. Note: This fault results in a STOP A that cannot be acknowledged. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on). - check the electrical cabinet design and cable routing for EMC compliance

---

<b>F30656</b>	<b>SI P2: Parameter processor 2 parameter error</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	When accessing the Safety Integrated parameters for the processor 2 in the non-volatile memory, an error has occurred. Note: This fault results in a STOP A that can be acknowledged. Fault value (r0949, interpret decimal): 129: Safety parameters for processor 2 corrupted. 131: Internal software error on processor 1. 255: Internal software error on processor 2.
<b>Remedy:</b>	- re-commission the safety functions. - replace the memory card or Control Unit. For fault value = 129: - activate the safety commissioning mode (p0010 = 95). - start the copy function for SI parameters (p9700 = D0 hex). - acknowledge data change (p9701 = DC hex). - exit the safety commissioning mode (p0010 = 0). - save all parameters (p0971 = 1 or "copy RAM to ROM"). - carry out a POWER ON (switch-off/switch-on) for the Control Unit.

<b>F30659</b>	<b>SI P2: Write request for parameter rejected</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The write request for one or several Safety Integrated parameters on processor 2 was rejected. Note: This fault does not result in a safety stop response. Fault value (r0949, interpret decimal): 10: An attempt was made to enable the STO function although this cannot be supported. 15: An attempt was made to enable the motion monitoring functions integrated in the drive although these cannot be supported. 16: An attempt was made to enable the PROFIsafe communications although this cannot be supported. 18: An attempt was made to enable the PROFIsafe function for Basic Functions although this cannot be supported. 20: An attempt was made to simultaneously enable both the drive-integrated motion monitoring functions via integrated F-DI and STO via terminals, even though these cannot be supported at the same time. 28: An attempt was made to enable the "STO via terminals at the Power Module" function although this cannot be supported. See also: r9771 (SI common functions (processor 1)), r9871 (SI common functions (processor 2))
<b>Remedy:</b>	For fault value = 10, 15, 16, 18: - check whether there are faults in the safety function alignment (F01655, F30655) and if required, carry out diagnostics for the faults involved. - use a Control Unit that supports the required function. For fault value = 28: - use the power unit with the feature "STO via terminals at the Power Module". Note: F-DI: Fail-safe Digital Input STO: Safe Torque Off

---

<b>F30662</b>	<b>Error in internal communications</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	A module-internal communication error has occurred. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on). - upgrade firmware to later version. - contact Technical Support.

---

<b>F30664</b>	<b>Error while booting</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	An error has occurred during booting. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on). - upgrade firmware to later version. - contact Technical Support.

**F30665 SI P2: System is defective**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A system defect was detected before the last boot or in the actual one. The system might have been rebooted (reset).  
Fault value (r0949, interpret hexadecimal):  
200000 hex, 400000 hex:  
- fault in the actual booting/operation.  
Additional values:  
- defect before the last time that the system booted.  
**Remedy:**  
- carry out a POWER ON (switch-off/switch-on).  
- upgrade firmware to later version.  
- contact Technical Support.  
For fault value = 400000 hex:  
- ensure that the Control Unit is connected to the Power Module.

---

**A30693 (F) SI P2: Safety parameter settings changed, POWER ON required**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** Safety parameters have been changed; these will only take effect following a POWER ON.  
Notice:  
All changed parameters of the safety motion monitoring functions will only take effect following a POWER ON.  
Alarm value (r2124, interpret decimal):  
Parameter number of the safety parameter which has changed, necessitating a POWER ON.  
**Remedy:**  
- execute the function "Copy RAM to ROM".  
- carry out a POWER ON (switch-off/switch-on).

---

**A30788 Automatic test stop: wait for STO deselection via SMM**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The automatic test stop was not able to be carried out after powering up.  
Possible causes:  
- the STO function is selected via Safety Extended Functions.  
- a safety message is present, that resulted in a STO.  
**Remedy:**  
- Deselect STO via Safety Extended Functions.  
- remove the cause of the safety messages and acknowledge the messages.  
The automatic test stop is performed after removing the cause.

---

**N30800 (F) Power unit: Group signal**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** NONE  
**Cause:** The power unit has detected at least one fault.  
**Remedy:** Evaluate the other messages that are presently available.

---

**F30802 Power unit: Time slice overflow**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A time slice overflow has occurred.  
Fault value (r0949, interpret decimal):  
xx: Time slice number xx

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

---

#### **F30804 (N, A)**

#### **Power unit: CRC**

**Message class:** Hardware/software error (1)

**Reaction:** OFF2 (OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A checksum error (CRC error) has occurred for the power unit.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

---

#### **F30805**

#### **Power unit: EEPROM checksum error**

**Message class:** Hardware/software error (1)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** Internal parameter data is corrupted.  
Fault value (r0949, interpret hexadecimal):  
01: EEPROM access error.  
02: Too many blocks in the EEPROM.

**Remedy:** Replace the module.

---

#### **F30809**

#### **Power unit: Switching information not valid**

**Message class:** Hardware/software error (1)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** For 3P gating unit, the following applies:  
The last switching status word in the setpoint telegram is identified by the end ID. Such an end ID was not found.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

---

#### **A30810 (F)**

#### **Power unit: Watchdog timer**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When booting it was detected that the cause of the previous reset was an SAC watchdog timer overflow.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

---

#### **F30850**

#### **Power unit: Internal software error**

**Message class:** Hardware/software error (1)

**Reaction:** OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred in the power unit.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- replace power unit.
- if required, upgrade the firmware in the power unit.
- contact Technical Support.

---

**F30903**      **Power unit: I2C bus error occurred**  
**Message class:** Hardware/software error (1)  
**Reaction:** OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** Communications error with an EEPROM or an analog/digital converter.  
Fault value (r0949, interpret hexadecimal):  
80000000 hex:  
- internal software error.  
00000001 hex ... 0000FFFF hex:  
- module fault.  
**Remedy:** For fault value = 80000000 hex:  
- upgrade firmware to later version.  
For fault value = 00000001 hex ... 0000FFFF hex:  
- replace the module.

---

**A30920 (F)**      **Temperature sensor fault**  
**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** When evaluating the temperature sensor, an error occurred.  
Alarm value (r2124, interpret decimal):  
1: Wire breakage or sensor not connected.  
KTY: R > 2120 Ohm, PT1000: R > 2120 Ohm  
2: Measured resistance too low.  
PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm  
**Remedy:** - make sure that the sensor is connected correctly.  
- replace the sensor.

---

**F30950**      **Power unit: Internal software error**  
**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret decimal):  
Information about the fault source.  
Only for internal Siemens troubleshooting.  
**Remedy:** - if necessary, upgrade the firmware in the power unit to a later version.  
- contact Technical Support.

---

**A30999 (F, N)**      **Power unit: Unknown alarm**  
**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An alarm occurred on the power unit that cannot be interpreted by the Control Unit firmware.  
This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
Alarm value (r2124, interpret decimal):  
Alarm number.  
Note:  
If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.  
**Remedy:** - replace the firmware on the power unit by an older firmware version (r0128).  
- upgrade the firmware on the Control Unit (r0018).

<b>F35950</b>	<b>TM: Internal software error</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2 (NONE)
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	An internal software error has occurred. Fault value (r0949, interpret decimal): Information about the fault source. Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- if necessary, upgrade the firmware in the Terminal Module to a later version. - contact Technical Support.

<b>A50001 (F)</b>	<b>PROFINET configuration error</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A PROFINET controller attempts to establish a connection using an incorrect configuring telegram. The "Shared Device" function has been activated (p8929 = 2). Alarm value (r2124, interpret decimal): 10: A/F-CPU configures mixed PZD/PROFIsafe telegram. 13: F-CPU and PROFIsafe is not activated (p9601.3). 15: PROFIsafe telegram of the F-CPU does not match the setting in p9501.30. See also: p9601 (SI enable functions integrated in the drive (processor 1))
<b>Remedy:</b>	Check the configuration of the PROFINET controllers as well as the p8929 setting.
<hr/>	
<b>A50010 (F)</b>	<b>PROFINET: Consistency error affecting adjustable parameters</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A consistency error was detected when activating the configuration (p8925) for the PROFINET interface. The currently set configuration has not been activated. Alarm value (r2124, interpret decimal): 0: general consistency error 1: error in the IP configuration (IP address, subnet mask or standard gateway). 2: Error in the station names. 3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists. 4: a cyclic PROFINET connection is not possible as DHCP is activated. Note: DHCP: Dynamic Host Configuration Protocol See also: p8920 (PN Name of Station), p8921 (PN IP address), p8922 (PN Default Gateway), p8923 (PN Subnet Mask), p8924 (PN DHCP Mode)
<b>Remedy:</b>	- check the required interface configuration (p8920 and following), correct if necessary, and activate (p8925). or - reconfigure the station via the "Edit Ethernet node" screen form (e.g. with STARTER commissioning software). See also: p8925 (Activate PN interface configuration)
<hr/>	
<b>A50011 (F)</b>	<b>Ethernet/IP: configuration error</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	An EtherNet/IP controller attempts to establish a connection using an incorrect configuring telegram. The telegram length set in the controller does not match the parameterization in the drive device.
<b>Remedy:</b>	Check the set telegram length. For p0922 not equal to 999, then the length of the selected telegram applies. For p0922 = 999, the maximum interconnected PZD (r2067) applies. See also: p0922 (PROFIdrive PZD telegram selection), r2067 (PZD maximum interconnected)

<b>A50020 (F)</b>	<b>PROFINET: Second controller missing</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The PROFINET function "Shared Device" has been activated (p8929 = 2). However, only the connection to a PROFINET controller is present.
<b>Remedy:</b>	Check the configuration of the PROFINET controllers as well as the p8929 setting.
<b>F50510</b>	<b>FBLOCKS: Logon of the run-time group rejected</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	When the run-time groups of the free function blocks attempted to log on with the sampling time management, the logon of at least one run-time group was rejected. Too many different hardware sampling times may have been assigned to the free function blocks.
<b>Remedy:</b>	- check number of available hardware sampling times ( $T_{\text{sample}} < 8 \text{ ms}$ ) (r7903).
<b>F50511</b>	<b>FBLOCKS: Memory no longer available for free function blocks</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	When the free function blocks were activated, more memory was requested than was available on the Control Unit.
<b>Remedy:</b>	Not necessary.
<b>A50513 (F)</b>	<b>FBLOCKS: Run sequence value already assigned</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	An attempt was made to assign a run sequence value already assigned to a function block on this drive object to another additional function block on the same drive object. A run sequence value can only be precisely assigned to one function block on one drive object.
<b>Remedy:</b>	Set another value that is still available on this drive object for the run sequence.
<b>A50517</b>	<b>FBLOCKS: Int. meas. active</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A Siemens internal measurement has been activated.
<b>Remedy:</b>	Carry out a POWER ON (switch-off/switch-on) for the Control Unit involved.
<b>F50518</b>	<b>FBLOCKS: Sampling time of free run-time group differs at download</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	In the STARTER/SCOUT project that was downloaded, the hardware sampling time of a free run-time group ( $1 \leq p20000[i] \leq 256$ ) was set to a value that was either too low or too high. The sampling time must be between 1 ms and the value r20003 - r20002. If the sampling time of the selected free run-time group is $< 1 \text{ ms}$ , the equivalent value of 1 ms is used. If the value $\geq r20003$ , then the sampling time is set to the next higher or the same software sampling time $\geq r21003$ . Fault value (r0949, interpret decimal): Number of the p20000 index of the run-time group where the sampling time is incorrectly set. Number of the run-time group = fault value + 1

- Remedy:**
- correctly set the sampling time of the run-time group.
  - if required, take all of the blocks from the run-time group.

**Note:**

Fault F50518 only detects an incorrectly parameterized run-time group. If, after correcting p20000[i] in the project, this error occurs again at download, then the run-time group involved should be identified using the fault value (r0949) and the sampling time correctly set.

Abbreviation	Source of abbreviation	Significance
<b>A</b>		
A...	Alarm	Warning
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog-Digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced Operator Panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American coding standard for the exchange of information
AS-i	AS-Interface (Actuator Sensor Interface)	AS-Interface (open bus system in automation technology)
ASM	Asynchronmotor	Induction motor
AVS	Active Vibration Suppression	Active load vibration damping
<b>B</b>		
BB	Betriebsbedingung	Operation condition
BERO	-	Contactless proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	BG-Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output

i. V.	In Vorbereitung	Under development: This property is currently not available
I/O	Input/Output	Input/output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Startup
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Insulated gate bipolar transistor
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor power switch with integrated control electrode
IL	Impulslöschung	Pulse suppression
IP	Internet Protocol	Internet protocol
IPO	Interpolator	Interpolator
IT	Isolé Terre	Non-grounded three-phase line supply
IVP	Internal Voltage Protection	Internal voltage protection
<b>J</b>		
JOG	Jogging	Jogging
<b>K</b>		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-How Protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY84	-	Temperature sensor
<b>L</b>		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light emitting diode

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Significance</b>
LIN	Linearmotor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least Significant Bit
LSC	Line-side converter	Line-side converter
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
<b>M</b>		
M	-	Symbol for torque
M	Masse	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product code
MM	Motor Module	Motor Module
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (class 1) and slave
MSC	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
<b>N</b>		
N. C.	Not Connected	Not connected
N...	No Report	No report or internal message
NAMUR	Normenarbeitsgemeinschaft für Mess- und Regeltechnik in der chemischen Industrie	Standardization association for measurement and control in chemical industries
NC	Normally Closed (contact)	NC contacts
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization association in USA (United States of America)
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contacts
NSR	Netzstromrichter	Line-side converter
NTP	Network Time Protocol	Standard for synchronization of the time of day
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory

Abbreviation	Source of abbreviation	Significance
<b>O</b>		
OA	Open Architecture	Software component which provides additional functions for the SINAMICS drive system
OAIF	Open Architecture Interface	Version of the SINAMICS firmware as of which the OA-application can be used
OASP	Open Architecture Support Package	Expands the STARTER commissioning tool by the corresponding OA-application
OC	Operating Condition	Operation condition
OEM	Original Equipment Manufacturer	Original equipment manufacturer
OLP	Optical Link Plug	Bus connector for fiber-optic cable
OMI	Option Module Interface	Option Module Interface
<b>P</b>		
p...	-	Adjustable parameters
P1	Processor 1	CPU 1
P2	Processor 2	CPU 2
PB	PROFIBUS	PROFIBUS
PcCtrl	PC Control	Master control
PD	PROFIdrive	PROFIdrive
PDC	Precision Drive Control	Precision Drive Control
PDS	Power Unit Data Set	Power unit data set
PE	Protective Earth	Protective ground
PELV	Protective Extra-Low Voltage	Safety extra-low voltage
PFH	Probability of dangerous failure per hour	Probability of dangerous failure per hour
PG	Programmiergerät	Programming device
PI	Proportional integral	Proportional integral
PID	Proportional integral differential	Proportional integral differential
PLC	Programmable Logic Controller	Programmable logic controller
PLL	Phase-locked loop	Phase-locked loop
PM	Power Module	Power Module
PMSM	Permanent-Magnet Synchronous Motor	Permanent-magnet synchronous motor
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point-to-Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PT1000	-	Temperature sensor
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point-To-Point	Point-to-point
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data

Abbreviation	Source of abbreviation	Significance
<b>Q</b>		
<b>R</b>		
r...	-	Display parameters (read only)
RAM	Random Access Memory	Speicher zum Lesen und Schreiben
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
REL	Reluctance motor textile	Reluctance motor textile
RESM	Reluctance Synchronous Motor	Synchronous reluctance motor
RFG	Ramp-Function Generator	Ramp-function Generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RLM	Renewable Line Module	Renewable Line Module
RO	Read Only	Read only
ROM	Read-Only Memory	Read-only memory
RPDO	Receive Process Data Object	Receive Process Data Object
RS232	Recommended Standard 232	Interface standard for a cable-connected serial data transmission between a sender and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of senders and receivers, also known as EIA485)
RTC	Real-Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space-vector approximation
<b>S</b>		
S1	-	Continuous operation
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SCC	Safety Control Channel	Safety Control Channel
SD Card	SecureDigital Card	Secure digital memory card
SDC	Standard Drive Control	Standard Drive Control
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switch
SESM	Separately Excited Synchronous Motor	Separately excited synchronous motor
SG	Sicher reduzierte Geschwindigkeit	Safely-limited speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Significance</b>
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe stop
SI	Safety Integrated	Safety Integrated
SIC	Safety Info Channel	Safety Info Channel
SIL	Safety Integrity Level	Safety Integrity Level
SITOP	-	Siemens power supply system
SLM	Smart Line Module	Smart Line Module
SLP	Safely Limited Position	Safely Limited Position
SLS	Safely-Limited Speed	Safely-limited speed
SLVC	Sensorless Vector Control	Sensorless vector control
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SMI	SINAMICS Sensor Module Integrated	SINAMICS Sensor Module Integrated
SMM	Single Motor Module	Single Motor Module
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SP	Safe Position	Safe position
SPC	Setpoint Channel	Setpoint channel
SPI	Serial Peripheral Interface	Serial peripheral interface
SPS	Speicherprogrammierbare Steuerung	Programmable logic controller
SS1	Safe Stop 1	Safe Stop 1 (monitored for time and ramp)
SS1E	Safe Stop 1 External	Safe Stop 1 with external stop
SS2	Safe Stop 2	Safe Stop 2
SS2E	Safe Stop 2 External	Safe Stop 2 with external stop
SSI	Synchronous Serial Interface	Synchronous serial interface
SSL	Secure Sockets Layer	Encryption protocol for secure data transfer (new TLS)
SSM	Safe Speed Monitor	Safe feedback from speed monitor
SSP	SINAMICS support package	SINAMICS support package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
<b>T</b>		
TB	Terminal Board	Terminal Board
TEC	Technology Extension	Software component which is installed as an additional technology package and which expands the functionality of SINAMICS (previously OA-application)
TIA	Totally Integrated Automation	Totally Integrated Automation
TLS	Transport Layer Security	Encryption protocol for secure data transfer (previously SSL)
TM	Terminal Module	Terminal Module

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Significance</b>
TN	Terre Neutre	Grounded three-phase line supply
Tn	-	Integral time
TPDO	Transmit Process Data Object	Transmit Process Data Object
TSN	Time-Sensitive Networking	Time-Sensitive Networking
TT	Terre Terre	Grounded three-phase line supply
TTL	Transistor-Transistor Logic	Transistor-Transistor-Logik
Tv	-	Rate time
<b>U</b>		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal time coordinated
<b>V</b>		
VC	Vector Control	Vector control
Vdc	-	DC-link voltage
VdcN	-	Partial DC-link voltage negative
VdcP	-	Partial DC-link voltage positive
VDE	Verband Deutscher Elektrotechniker	Verband Deutscher Elektrotechniker [Association of German Electrical Engineers]
VDI	Verein Deutscher Ingenieure	Verein Deutscher Ingenieure [Association of German Engineers]
VPM	Voltage Protection Module	Voltage Protection Module
Vpp	Volt peak to peak	Volt peak to peak
VSM	Voltage Sensing Module	Voltage Sensing Module
<b>W</b>		
WEA	Wiedereinschaltautomatik	Automatic restart
WZM	Werkzeugmaschine	Machine tool
<b>X</b>		
XML	Extensible Markup Language	Extensible markup language (standard language for Web publishing and document management)
<b>Y</b>		
<b>Z</b>		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
ZSW	Zustandswort	Status Word
